EXTRACT

From an Act prescribing Rules for the Government of the State Library, passed March 8th, 1861.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General and the Trustees of the Library.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 5, 1873.

VOLUME XXVII. Number I.

Arctic Travel and Adventure.

The recent disastrous termination of the Polaris expedition, resulting in the death of its noble leader, Captain Hall, and the virtual abandonment of the enterprise, has turned public attention to a great extent towards those icy seas. Since the events connected with the failure of the expedition have become public, people who never gave the subject a second thought, have begun to read the numerous works on Arctic exploration, and have a better idea of the purposes for which the different expeditions were inaugurated, and the objects they sought to accomplish. Opinions differ as to the practical results to follow, even if the most sanguine expectations were realized. Some people cannot comprehend how others will risk their lives, encounter hardships and peril, in all the severity of an Arctic climate, merely to prove or disprove a theory. Some who appreciate the endeavors of Livingstone, Speke, Burton, Du Chaillu and others in exploring Africa, fail to see any good in Arctic expeditions, while others see no practical value in either. However this may be, there is no doubt but that thousands of people have a mania for reading descriptions of travel and adventure in the icy regions of the North Pole, and who would, if they had a chance, make a rough and dangerous trip there with much more pleasure than to the sunny South Sea Islands, or anywhere else.

WHALING FLEET IN THE ARCTIC REGIONS.

Leaving aside all romance and theoretical conclusions as to travel in these regions, the hardy American whalers know that there is money to be made thereabouts, which is an all-sufficient incentive for them to go there. During the whaling season, the peculiar barks whose paint, rig, and boats distinguish their calling, may be seen searching the seas on both sides of the Continent for their bulky prey, and cruising about in every direction. The men become inured to hardship and rough weather, and seem to prefer the occupation to any other. It occasionally happens, however, that most disastrous consequences result in the voyages to the Arctic, and numbers of ships are lost every year. No year, perhaps, will compare with that of 1871, in loss of life and property. Among the perils recorded may be mentioned the loss of the Arctic whaling fleet in the ice off Icy Cape. The fleet consisted of 41 ships, which arrived off the Cape on the 6th of August. The wind was blowing from the northeast, bringing down large quantities of ice, so it was with difficulty that they worked their way to Blossom Shoals, latitude 70° 20′ north and 121° west. They found a passage here from half to three-quarters of a mile from the shore to the main body of ice, through which they passed. As they advanced it became wider, and the fleet kept ascending as far as Wainwright Inlet. During several weeks they had a number of severe storms and winds from south to northwest. Soon after the wind shifted to west, setting the ice on shore and drifting it with great force against the ships. Several ships were caught and crushed at that time. The former experience of the masters told them that at this season of the year the ice would float off shore, and they expected it would then do so. The ships were lying in a narrow strip of water with ice on one side and land on the other. The northeast gale, which it was expected would liberate them, did not come, but instead the southeast and southwest gales piled the ice and berge up until the vessels were crushed. Several ships were outside, and the crews of the wrecked ones took to their boats, abandoning their ships, and boarded those of their more fortunate comrades. An idea of the situation of these vessels, raised up and crushed by the ice, can be seen in the accompanying illustration. Only seven out of the forty-one ships were saved at the time, but several have been taken out of the ice since. The majority, however, were a total loss. The sailors experienced considerable hardships while in the open boats, but were safely brought to Honolulu by the rescued vessels and thence to this city.

The immense power of moving ice is well illustrated in this instance, and no doubt the experience of that cruise damped the ardor of many a whaler and incipient explorer. As these men work on a "lay" or share of profits, the whole voyage was a dead loss to them as well as the owners. Massachusetts was the heaviest sufferer, and most of the vessels belonged there. The whaling captains on this coast became great observers of the movements of currents, ice flows, tides, etc., and have a great stock of valuable information on such subjects. Many of them are very intelligent, observant men, who keep records of many peculiar facts which would not appear in an ordinary log-book. The Coast Survey is indebted to them for considerable valuable information concerning the coast about Alaska and above.

CORRESPONDENCE.

The Vienna Exposition.

[By our Special Correspondent—GUIDO KUSTEL.]

One-sixth of the time of the World's Exposition pssed away and certainly not to general satiefaction, or rather to nobody's satisfaction; and if there is an exception it might be limited to the Berliu newspapers, who delight in putting down the Exposition, Vienna and the whole Austrian people. Why, is not known, perhaps jealonsy is the cause. Those papers say the Exposition is a grand failnre, and in this they may be right, to some degree; although oue mouth out of six cannot be considered decisive, especially when the faot is known that from the day of the opening of the Exposition to the first of Jnne, twenty-five days out of thirty, were cold, disagreable and gloomy; and fifteen of the former, raiay. The rain and the Berlin news-writers, their correspondents included, seem to be the strongest

Opponents to the Success ot thc Exposition.

The nnfinished condition is to be regretted, but some consolatiou may be found in the reoollection of the Paris Exposition of 1867, where, iu spite of a great deal earlier commencemeat of a smaller concern, the park was, a month after the opening, a great deal more in disorder than is at present in Vienna. In fact, however, there is no disorder visible here, except in some places between the Industrial Palace and Machinery Hall. The Park in front of the Palace, with the basins and fountains, the alleys with large bloomiug trees, green carpets of English grass, etc., where a few months ago was nothing but a wilderness, looks like the work of magic; and if one considers all their gigantic creation, he must admit the possibility of the expenditure of twenty millions of florins, (as is said,) and this is the weak poiat, the point that might be a failure,—there will likely be a deficit.

But the Vienna people are not discouraged yet, they expect from the futnre what the month of May refused; the extravagant charges for board, lodging and so forth, are greatly reduced. After the rain comes sunshine, and there is no reason why the 10,000 Americans should not come after all, who have been advertised some days ago.

Notwithstanding the very unfavorable weather, the daily average of

Paying Visitors

In May, was, according to the *Neue Freie Presse*, 10,200, while at the same time, at the London Exposition of 1862, not more than 13,700 have been counted per day, in average. Bnt there are three millions aud a half of inhabitants in London, and less than one million in Vienna, so that, takiag also the difference of weather in consideration, Vienna is better off, in comparison, than London was, so far as the first month is concernod. But even if the month of May should be considered as prognosticating the futurc, the Vienna Exposition, in regard to visitors, would be equal with those of London and Paris; but there is good reason to expect a far better result.

Leaving the money business out of the question, the Expositiou of 1873,

As an International Affair,

The maia object of which is the stirring up of industrial emulation amongst all the nations of the world, by exhibiting the evidence of progress in all branches of industry and science, is the most brilliant success that could be expected. This is admitted by all who examine the matter from that point of view. On the first of June 28,704 persons visited the Exposition, although the rain poured down all day. The second of June was a olear lovely day, and iaduced 79,108 visitors to spend all the day in admiratiou and delight.

But the Exposition is uot yet complete. In the moet of the side-galleries the fixing-np goes on, more or less. The American department in the Industrial Palace is shnt up yet, but it has already a face, and will be opened in a ehort time; the American school-house, near the American department of the Indnstrial Palace, is almost ready. The American

Agricultural Hall

Does not show many interesting machines, which is much regretted by the German, Anstrian, and Hungarian farmers, who seem to give preference to Americaa machines. The Englisb are considered too heavy, and, in other respects, less practicsl. The English agricultural machines are coustructed in accordance with thoir local requirements, which are different in some respects from those on the Continent, but the Euglish manufacturers would not take any notice of it, till of late, when they observed, perhaps too late, that Germany and Austria commenced to turn out themselves seed-sowing and other machiues suitable for their horses, which are smaller and weaker than the Englisb. The Americsn mowing machines exhibitod here are praieed very much; they differ oonsiderably from the English. The former are light, elegant in shape, are made of the best material; the wood is hiokory and the cast-iron malleable. If anything is objectionable with thcm, it is that they may be even too light to do work for ten or fifteen years. Each machine has a comfortable seat for the driver, exactly in the right place, and mnch more appreciated here than the seats on the English machines of the same kind. The threshing machine is of the usual construction in the Unided States. Several American plows are exhibited, and amongst them a gang-plow, which creates a good deal of interest amongst people who nuderstand it. It is much regretted that no American hsy-making machinee have been exposed, especially those to rake, tnrn, and load the hay on the wagons. They are considered original and of great perfection, but there are yet many boxes yet untouched, containing perhaps some more of interesting machines.

In the Machinery Hatt

The work is progressing, but nothing is in motion yet—that is in the American department. Each land has its own power and a separate frame for the shafts and are entirely independent of each other. From the separate boiler honses the steam is conducted undergrouud to the engines, of which each country has its own motor, at the same time as an exhibited machine. The power is transmitted to the main shaft by belts. All the boxes for the main shafts are of Amerioan pattern, which allows a vertical and horizontal motion ia adjusting the shafts. From each main steam pipe, steam can be obtained for single maohines. Germany, Belgium, France and England have their shafts runaing every day, bnt only a small part of the maohinery is in motion as yet, it is, however, expected that in two weeks from now all will be in motion.

Japan

Is now open to all people. It is not only their gallery full of interesting objects, that attracts the visitors, but one is also able to see Japan. Behind the palace of the Viceroy of Egypt there are houses, gardens, streets, temples and bazars, and it gives a perfect picture of the Japanese life. The material which they use for building their houses, they shipped from Japan. It is the "Tschinocki" wood and "Singi" wood. It is a kind of cedar wood which spreads qnitc an agreeable odor when cut or planed. The Japanese are fond of flag-staffs and have several of them before the houses, the flags showing the flower "Aster" which is the signe of the reigning dynasty. This signe one meets everywhere in the Japanese quarters. Many Japanese plants have been shipped with the intention to increase the Japanese character of this small settlement, but the most of them spoiled before they arrived in Vienna; the bamboo however is sound. The housee on both sides of the street are two-stories high. The windows have no glass but are provided with fine wood oarving, through which the light is admitted; some have prepared paper. A small pond is at the end of the garden and a Japanese bridge of yellow wood leads over the pond to an artifiicial hill. The bridge is quite a nice work with elegant railings. On the top of the hill is a small temple, the "Mija." This temple is the model of one that was built not far from Kjotch, the old metropolis of Mi Kados in the land of Iche.

Arizona Mines.

A correspondent of the *Alta* writiug from Wallapai District, says: The wise policy of our great hero aud Indian fighter, General Crook, has already caused an influx of prospectors and capitalists iato the rich and uuexplored miaeral belts of this great Territory. If men of capital and brains could be induced to come here, they would realize more than the most sanguine of them could expect. Look, for instance, at the vast number of lodes in this district, being developed by the hardy and indnstrious miners, who, unaided by capital, have laid bare some of the rioh st rock ever lrought to sight; their dump piles will corroborate my statement.

All we ask is that some of the practical mining experts should summon up enough of courage to visit our district, aud especially some of our principal mines; for instance, the Lone Star, down 132 feet, noted for its rich silver-hearing quartz. They have about forty-five tons of rich specimens on the dnmp, any piece of which would be considered a beautiful cabinet specimen. The other day I had the pleasure of being introduced to the energetic Superintendent of the celebrated Ida Mine. This gentlman (Mr. John Lswson) has about sixty tons of ore on the dnmp, and by the glow of satisfactiou on his face, I am well assured that his reports of the richness of the ore are authentic. He has a large force at work, three shifts, and they are down 110 feet. The rock assays largely in gold, as well as in silver; and to show you the confidenee onr people have in this celebrated mine, I will merely state, as a fact, thst certificates in this mine are taken at three dollars per share in all transactions of business.

The Cupel and Tiger Mining Company are pushing things under the able management of Mr. Chas. Spencer, who is Superintendent. I have not been able to visit these valuable mines, but the reports are very favorable; the hoisting works, and a large force of mia ers are busy night and dsy.

The New Era is shipping six to eight hundred dollar rock to the mill at Mineral Park; and the Sixty-three mine is shipping rich ore to San Francisco.

Good reports are coming in from the new discovery, the Hope mine, but the Hibernia lode will do to swear by. Mr. Jas. Reid has a claim of fifteen hundred feet on this great dyke or lode of quartz, which is ten feet in width, and the croppiags assay $130 per ton. The croppings of the lead are easily found for 26 miles.

The San Diego Mines.

Our traveling correspondent writes us from Jnlian City, San Diego county, as follows:

The Golden Chariot is one of the principal mines in the county. The lowest grade of ore taken from where the ledge is 12 feet wide at a depth of 125 feet averages $50 per ton. The higher grade of ore where the ledge runs three feet wide and 125 feet deep, averages from $100 to $150 per ton. This mine is crushiug at present eight tons of ore per day, the cost of which does not exceed $4 per tou for milling. The last clean-np for two weeks ending the 8th inst. prodnced a gross yield of $10,000.

The mine has taken out rock, 100 tons of which yielded them the snug sum of $32,000; this we consider a very handsome clean np. The mine now runs a five-stamp mill, and will at an early day add five stamps more, increase the power of the engine, and provide greater facilities for the reduction of their ore. The mill now used by them was built upon qaite extensive plans, and will accomodate any improvements they may wish to add from time to time. The level in their mine is now run; they will commence stoping ia a few days, when they will take out some two or three hundred dollar rock. The Golden Chariot has shipped more gold to San Francisco mint from April 1st to Jnne 10th, on account of hsving their own mill than all the other mines combined that are located within the districts of Julian and Banner. This does not inolude the celebrated Stonewall. The present owners are James B. Lang, Joseph Coyne, and Duncan McLellan. The stamp mill is superintended by Chester Gunn. The mill is located 2½ miles from the mine. A good wagon road enables them to transport ore at $1.50 per ton—with water facilities and everything required—to their hand.

An extension of the Golden Chariot was recently discovered by Henry Youug and Harry Worth, nine miles southeast. The ore taken from this extension, which is only croppings, assays $20 to the ton, with a positive lead of 2,000 feet, making this a real "chip of the old block."

The Stonewall Mine.

The Stonewall is located at the foot of the Cnyamaca Peaks, seven and a half miles from Julian City. The ledge runs from five to twenty-six feet in width at a pitch of 70 degrees to the west. Hanging wall, slate; foot wall, granite. The walls average twelve feet apart. This entire space is good paying ore, except at times a small strata of what miners term "horse," which is a conglomerate of slate granite and quartz. Notwithstanding this, the Stonewall runs everything throngh their stamps and find it quite profitable, which confirms the previous statement of its being one of the most regular paying miaes within our State. Their shipments of bullion are about $10,000 per month at a cost to them of $2,000 per month.

Their facilities of machinery and convenience of wood, timber, lumber, etc., make the actual cost of working this mine a mere trifle, as no blasting has yet been done or is likely to be required. The shaft was sunk to a depth of 60 feet, and a level run 500 feet; at the north end of this level 100 feet has been stoped to the snrface, averaging 12 feet in width. At the soath end 36 feet has been stoped with the same average width. This shaft has been continued to a depth of 140 feet, and a level each way run 150 feet.

The width of the ledge continaes with rock a little harder and the gold a little coarser. Their mill is a new ten-stsmp mill, erected about six months ago. The building is 60 by 100, and is so sitnated that when the rock is dumped from the mine no handling is required from thence to the battery. Their engine is forty-horse power and a boiler capacity sufficient to run a twenty-stamp mill. The superinteadent, Mr. A. P. Frary states that $3-rock can be run at a profit. Upon examination of the lower level which is 140 feet in depth, with a level run 300 feet; some idea of the immensity of this mine may be had, especially when we remember that the rock intervening is all good paying ore; it being generally understood by experienced miners, that when a water level is reached a ledge of ore is likely to continue to an indifinite period. Their criterion is that as yon find it at water level so it likely continnes for 1,000 to 1,500 feet or more; and should the Stonewall prove its present prospects, the time will come when its present owners will look at no price. The present owners of this mine are A. P. Frary, F. E. Farley, and J. M. Farley. The Stonewall mine is not in dispute, their title to property being clear and valid.

The Owens Mine

Is located within the Julian District, one-half mile from Julian City. The ledge runs from one to six feet wide at a depth of 300 feet. This mine is now being sunk to a depth of 600 feet, and in the meanwhile will run levels and stope when it is found necessary. The rock average $75 per ton, at the depth of 275 feet; the rock now prospects on the lower level $75 per ton. A uew ledge hss been discovered which is likely to run into the original, which will make an immense ledge. Work on this mine is progressing day and night under the snperintendency of W. R. DeFrees—who takes charge from and after this date, June 12th, 1873. The present owners of this mine are W. R. DeFrees, A. DeFrees, T. S. Moore, James Kelly, H. J. Booth. Their mill is situated oae-half mile from the miue where an abundance of water can be had and wood obtained at a trifling expense.

This mine crushes 14 tons of ore per day through a 10-stamp mill, at a cost of $2.50 per ton. The machinery nsed, both at the mine and mill, are of the best make, and have all the late improvements, making their facilities equal, if not superior, to other mines in this district. Their hoisting machinery at the mine is very fine, with a wire rope of 600 ft., warranted to hoist 8,000 lbs.; also an improved engine, which can be worked and reversed as required. Twenty men are employed day and night at their mine and seven at their mill.

The Tom Scott and Eureka.

The ledge has been sunk to the depth of 100 feet. The ledge will average in width from two to four feet, and prospects—rock finer and gold coarser. There never has been taken from these mines one tub of ore which failed to show free gold. These mines have been self-supporting. The owners are C. W. Swain, W. W. Swain, O. L. Bashford, and W. H. Jnlian.

The California

Is one thousand feet due west of the "Owens" mine. The ledge averages 2 feet wide and 110 feet deep, hanging wall and foot wall slate; width of walls 8 feet. Work will be resumed July 1st, by D. H. Snyder and Ira Wentworth, its present owners. The rock taken from the mine will average $18—three hundred tons of which gave a yield of $5,400.

The Helvetia

Is located one mile from Julian City. The ledge runs an average width of three feet, with walls of about 6 feet; hanging and foot walls, both slate. The depth of ledge is 240 feet; tho rock will average from $28 to $30 per ton. Work upon this mine is continued day and night. An addition of owners in this mine will insure its "forward march," as machiaery for working the mine thoroughly will be placed in position before the 1st of August.

The Ready Relief

Is owaed by Baily Bros., and is located about 4 miles east of Julian, in Bauner District. The ledge runs from 2 to 6 feet. The depth of this ledge is from 100 to 150 feet. The rock which this mine mills will rnn from $75 to $100 per toa. They are running both mine and mill day and night by water power.

The Eagle Mine

Is located within 400 yards of Julian City. The ledge is from 2 to 2½ feet wide; wall slate, 125 feet deep, with one drift due west, connecting with maiu shaft by tunnel. The rock is of a rebellions nature. Its owners are, Robt. Leelie, D. Lipman and T. Bundy.

West Point Mines.

After the letter of our correspondent, "L. P. Mc," came to hand and was printed in our last issne, he sent ns some additional particulars from West Point, Calaveras County, as follows: There are at this present time, quite a number of gold mines being worked in this locality—this district has been very much neglected for some years in point of capital, and the mines have been chiefly worked by Mexicans down to the water level, and hard formation of the country rock. They have always found good pay at this distance, as they seldom send any ore to the custom mills that does not pay from 20 to 30 dollars per ton.

Among the prominent mines, is the Pancho, only a short distance from the Lone Star Mine. This mine is being worked by means of tunnels, of which there are five run in on the ledge, all in good ore. No machinery is required to work this mine to advantage. The qnartz shows free gold in paying quantities. Then comes the Josephine mine, on the same side, but facing the Middle Fork of the Moklumne River. This mine has also valuable property, and has been worked by shafts, and one or two small tunnels, paying good profits to its present owners. On the opposite side of the river, is the celebrated Woodhouse lead, now being worked with paying results.

Up the other way from West Point, on what is known as Skull Flat is the Zacatara, and the old Billy Williams mine which have tarned ont good results in their day.

"The Ohio Consolidated Mine,"

Is principally owned by San Francisco parties. This mine was incorporated March 13, 1872, with 25,000 shares, and like many other miaes badly managed nntil of late.

The Company fonnd it to their advantage to employ a thorough and practical Superintendent, Mr. S. D. Merchant, who has pnt the whole thing in good shape, and upon a paying basis. He now has the shaft down 150 ft., with drifts, and a large body of ore in sight. They are now crushing ore which promises good resnlts.

The election of trustees took plsce on Jnne 19, 1873, as follows: W. G. Wayman (President), Benj. Dore, G. W. Stuart, Jas. Fulton, W. J. Hamilton, W. Aag. Kaapp (Secretary), National Gold Bank and Trnst Compaay (Treasurer).

The following item iu relation to this mine I clip from a city paper: Letters from West Point state that the Snperintendeat aow has a mnch larger body of ore in sight than he had anticipated from former knowledge of the mine, and that the future outlook of the company is of the most flattering kind. The connection in the raise with the drain-tnnnel and the ventilation is now perfect. The raise shows an un-

broken lode from top to bottom. The probabilities are that there will be ore yet for 150 feet sonth. A cross-course was struck a few days ago, the first one yet known in the district; it adds greatly in value to the mine. The improvements at the mine consist of excellent hoisting works, with water power; a drain-tunnel, 330 feet in length; north drift over 30 feet; cross-drift 41 feet long; raise, 32 feet high; north stope, open some 60 feet, with about 50 tons of ore on the dump, which prospects and will assay from $50 to $60 por ton. The cross drift to the east veiu will be in by the 15th inst., when the main body of ore will he reached 80 feet below where it has been worked; it paid at that point above, by mill process, $77 per ton.

In additiou to the above, it is known that the company has not a dollar of indebtedness, and all this has been accomplished in the most economical manner. Only three assessments have been levied during the past fifteen months, and within thirty days the company will have the result of their first crushings.

Numbering or Classifying the Comstock Mines.

A thoughtful correspondent, (A. F. G., of Sacramento), referring to the advantage to ontsiders of having the various mines on the Comstock so numbered or lettered that the relative position of each on the great lode can thereby be easily determined by the casual observer, recommends that in our table of fluctuations we divide mines into their natnral divisions, viz: Sonth West Branch, South East Branch, (startiog from Silver City or Daney, running east to Seg. Belcher), and then Maln Comstock lead.

We have simply to say that without arranging them in alphabetical order, so far as our table is concerned, it would be impracticable for us to make the constant changes occurring in the figures with facility and correctness.

SCIENTIFIC PROGRESS.

Rotation of Liquids.

In a recent French *Journal of Science* is a paper by M. Desire Gernetz, on the rotation of liquids. M. Gernetz says: When a ray of light falls on an inclined plane which reflects it through a tnbe similsrly inclined at a certain angle (56° in atmospheric air), then, if the reflected ray lies in the same plane with the incideut ray, there is no loss of light; but if the two rays lie in different planes, the reflected one will be weaker, and even be hsrdly visible, if at right angles to the plane of the other; the light is then said to be polarized. Now, in passing through different substances, the angle of the two planes is called the power of rotation, because you would have to turn one of the planes round a certain number of degress, in order to obtain the beam of light in its natural state. This power of rotation was first observed in qnartz, by Arago, in 1811, and in various liquids, by Biot, in 1815.

When the plane of polarization devistes to the right, it is called dextrogyre; when to the left, *levogyre*. M. Gernetz'a experiments tend to determine the rotstory power of certain liqnids at different temperatures, by means of certain delicate arrangements, which it is not our province to describe; the liquids experimented npon being essence of turpentine, which is levogyre, the essences of sweet and bitter oranges, and a solution of camphor, which are all dextrogyre. 1. The results st which he arrives are these: The rotatory power of active liquids for the same ray right of light depends upon the temperatnre; 2. Wheu the temperature approaches boiling-point, the rotary power varies with some rapidity; 3. When the liquid is reduced to the state of vapor, the rotatory power does not change its direction; that is, it remains levogyre, if it was so before, and conversely; and 4. The lsw of dispersion of the plane of polarization of any ray of the solar epectrum is the same at all temperatnres.

Practical Use of the Carbonic Acid Resulting from Fermentation.—E. Pfeiffer has devised a plan for economizing the waste carbonic acid resulting from the fermentation of wort, the manufacture of vinegar from champagne vats, and the like. The fermenting vessels are covered, and, by means of exhausters, the air is drawn off and is fonnd to contain from twenty to twenty-five per cent. carbonic acid. This can serve for the manufacture of bicarbonates, and, if the gas were to be condensed, could be converted into a motive power, employed in the manufacture of soda water, or nsed for artificial refrigeration. At any rate, there wonld appear to be no reasonable excuse for wasting so mnch carbonic acid. If somebody would only devise a practicable plan by which the enormous amount of carbonio acid, produced by gas burners or axhaled from the lungs of large audiences in onr churches, theaters, aud public halls, could be drawn off, got ont of the way, and devoted to some purpose more useful than suffocating and poisoning multitudes of people, he would confer a great boon on mankind, and would be cordially welcome to any remnneration he could make out of it. In other words, why cannot somebody devise a system of ventilation that will be accepted at once as feasible, and thus put a stop to complaints on this subject?

Percolation of Gases.

Much has been accomplished by the researches of Graham and others, bnt still there is mnch more yet to be learned concerning the laws regulating the passage of gases through, both porous substances, and membranes, aud even through the dense medinm of iron.

Mr. Andsell, of the British Royal Miut, who hae been experimeuting npon the gases of mines, with a view to discover a satisfactory method of detecting explosivo compounds, has just observed a phenomenon which must be of interest to all physicists. He has discovered that some gases will travel with rapidity through biscuit-ware and not through india-rubber, and conversely that others will pass readily through india-rubber, but not through biscuit-ware. Mr. Andsell hae fouud that if a glass cylinder be intercepted at its middlo by a plato of biscuit-ware securely cemented in, and that then one end of the cylinder be covered with a thin sheet of india-rubber, and defusion allowed to proceed through the latter, the gas (especially coal gas) which has passed through the india-rubber, remains botween that snbstance and the biscuit-ware, exerting considerable force, although the other end of the cylinder be perfectly open to the atmosphere. The explauation of this phenomenon, Mr. Andsell believes, is to be sought in the existence of two forms of the same gas whicb possess entirely opposito pormeating powers.

M. Henri St. Clair, has also reported the following interesting experiment observed during his researches on the penetrability of iron by gases:

In a previous paper, this chemist had ehown that hydrogen contained iu an iron tnbe will ooze through its poree if heat bo applicd, a fact easily explained by the expsnsion of the metal consequent upon an increase of temperature. In the present case, M. Deville introdnced an iron tubo into a porcelain one, so as to form an empty cylindrical spsce between the two closed at both ends. He then filled both inner and outer spaces with nitrogen, and heated the apparatus, after which he caused hydrogen to pass into the annular space, taking care to measure the pressure, which soon became doubled in the iron tube. On analyzing the gas contained in the latter, he found it to consist of hydrogen and nitrogen, the former being in by far greater qnantity than the latter, besides a little oxide of carbon. This shows that the hydrogen had penetrated throught the tube.

Departure of Plants from their Original Types.—Few people have a clear idea of how widely some plants have departed from their original types. New races of plsnts come into existence which are so differeut from the plants from which they sprnng that, if found in a wild state, no botanist would hesitate a moment to place them in different genera. The cauliflower and cabbage, for instance, have all "progressed" from the same original, which is a coarse weed wild on the chalk hills along the seacoast of Europe, and so nnlike the cabbage and the cauliflower that no one would suspect it to be the parent of either of them. These facts have been seized npon by some evolutionists as favoring their theory. But, without regard here to our own opinion on the trnth of evolutionary views, as generally held, and with a sole view to truth as science presents it to us, we think these facts do not aid these views very much; for, different as these two kinds of plants are from the wild type, they themselves show no disposition to go any fnrther. The wild plant brought forth a cabbage and s canliflower, but the cabbage and csuliflower show no disposition to produce other distinct things, but rather, to bring forth closely after their own kind—simply continuing to improve by cnltivation, but always within their own specific sphere.

Saponification.—At a recent meeting of the Paris Academy of Sciences, M. Pelouze read a paper on the saponification of fatty substances by alkaline sulphurets. Tallow and oils contain fatty acids combined with glycerine, and the elimination of the latter constitutes saponification. If effected by certain metallic oxides —soda and potash, the compound thus obtained is called soap; and hence the substance known nnder that name consists of a fatty acid combined with potash of soda, and deprived of glycerine. Many years ago, M. Pelouze, after discovering that alkaline salts could produce soap without the intorvention of water, found that akaline sulphnrets possessed a similar property. Having taken np these experiments again, he prepared some crystals of mono-sulphuret of sodinm, and mixed them with their weight of tallow or oil. After a contact of several days, the fatty matter was found completely saponified. By boiling this soap in water, hydrosulphuric acid is evolved, and, if this operation be continued, the mono-sulphuret of sodium is reconstituted.

The painful effect of artificial light npon the eyes is attributed by recent investigators to the great proportion of non-luminous rays, or rays of mere caloric bearing no illumination, which it contains. In sunlight there are 50 per cent. of such rays, in gaslight nearly 90, in olectric 80, in kerosene light 94. A German chemist named Landsberg has discovered that by passing any kind of artificial light through a thin layer of alum or mica, these caloric rays are absorbed, while the illuminating power of the light rays is undiminished, and becomes exceedingly mild and pleasant to the eyes.

Scientific Prize-Award.—The Academy of Sciences, at Paris, have awarded their purse of $10,000 to Mr. Gramme, for his electro-magnetic machine, which is one of the simplest and most efficient that has yet been invented. The constrnction is so free from complications that the iostrument will work and give a continuous current for months together, and to those who know anything of the subject, these will appear as results of the highest importance. Ouo of the uses to which this machine may be immediately applied is the production of a light of intense brilliancy, which will be seen farther than any other electric light yet known. One of the French steamship companies ie about to use this light on their vessels as a precautiou against collisions or other casualties, and it is obvious it can be made of great general utility.

MECHANICAL PROGRESS.

A Valuable Invention—Enameled Brick.

We have alrsady made some allnsion to the recent invention by Mr. Clark of Connecticnt, of a process for preparing an enameled brick for building purposes. It seems that a large company has recently been organized in Philidelphia for the purpose of manufacture. The *American Manufacturer*, in speaking of this new article of mannfacture, says: The process of enameling or glazing pottery and procelain has long been known, and even bricks have been glazed by what is known as the salt process; but the glszing ie too perishable to be extensively nsed. There hss also been another difficulty in all previous processes of enameling. Litharge, or the protoxide of lead, has always been nsed; so essential has this been deemed that it is asserted that it is impossible to produce an enamel without its nse.

Mr, Clark has, howevor, snoceeded in finding a substitute for lead, and has thns svoided the cracking or "crazing" to which all enamels of which lithsrge is a component, is liable.

The minerals used for the ensmel are feldspar, flint, China clay, fluorspar, and the substitute for lead. These are melted together, and upon cooling are broken into bits looking like flints in size and fracture. These are then ground to a powder under French burrs, so exceedingly fine that it feels to the touch of the finger like the best quality of flour, and as a liquid it flows throngh a net containing 10,000 meshes to the square inch. This powder is placed in a snitable vessel and mixed with water until it assumes the consistency of the thin "skim" used by plssterers. It is naturally white, hut almost any color that can be produced in painting can be had by adding the nccessary material. When the enamel has been thus prepared, it is ready for application by simply dipping the face of the brick into it. The paste readily adheres, the spongy qnality of the bricks drawing it into the pores, and giving it a firm gsip as it hardens. The brick, as soon as dipped, and while the enamel is still in a eoft state, sre plsced in sqnsre boxes made of fire clsy, face side up, and conveyed to a heating kiln, where they are subjected to a heat ranging between fourteen hundred and seventeen hnndred degrees Fahrenheit, according to the quantity of the flint in the enamel. The heat fnses the preparation, and the brick being in an exactly upright position, the ensmel settles evenly on the face, and is ready to be removed and cooled for nse.

The advantages of this invention are numerons. The brick presents a most beautiful fsce, smooth, hard, polished, and, as shown by a series of the severest chemical and mechanicsl tests, almost indeetructible. Heat and cold are alike powerless to affect the enamel; a blow sufficient to drive a nail into wood produces not the slightest crack or flaw. Acids or other corrosive liquids do not attsck it.

The company have received an order from the Building Commitee of the Centennisl Commission at Philadelphia, for 200,000 of these bricks, which they intend using in the construction of some of their buildings.

A prominent railroad official designs using these bricks for lining the inside walls of some of the machine shops of the company, as a matter of economy in light—the shops being so dark as to require the almost constant use of gas in the winter months. The pure white enamel, for this pnrpose, would constitute an excellent reflector, and would render shops as light as a parlor painted in white.

It is invaluable in building bank vaults, foundations, or in any sitnation where absolute freedom from dampness is necessary. The great advantage is their cheapness. They can be delivered at sixty dollars per thousand, when the ordinary brick cost forty dollars. Philadelphia pressed brick are worth sixty dollars per thousand exclusive of the cost of delivery, and an ordinary three story front can be put up withthese elegantly colored bricks at about one hnndred dollars less than the cost of the Philidelphia brand. Tho enameled bricks are larger than the ordinary makes, which is also an item in their favor.

It is of course understood that it is not to the manufacture of brick alone that this enamel is adapted. There is no nse to which porcelain has been pnt that thia is not applicable. For enameling stove fronts, kettels, etc., it is unsnrpassed. We also imagine that in the chemical arts it mnst be invaluable. In acid manufacture where a substance free from the influence of corrosion is absolutely needed, this must be employed.

Progress in the Manufacture of Mirrors.

In the year 1782, the price in Europe of a mirror of ten sqnare feet, amonnted to 265 franes, 5.35 francs being equal to one gold dollar. In 1805, the price of a mirror of the same size was 225 francs, and two years sgo it only amounted to one-fifth of this sum, or 45 francs. But the differences in price are still greater for the large mirrors. From the year 1805 to the year 1865, the price of a mirror of forty square feet went down from 400 francs to 262 francs. In 1688, it wss not considered possible to cast a mirror containing eighteen sqnare feet; bnt five years later, Lucas, in Nehou, succeeded in casting plates containing thirty feet; and in 1834, Saint Gobin exhibited a plate of one hnndred square feet. In 1849, he produced one containing one hnudred and thirty feet; at the first London Exhibition, one of one hundred and forty-two; at tho first Paris Exhibition, one of one hnndred and eighty-three; and at the last International Exhibition, one of two hundred and twenty square feet. This last mirror is the largest ever oast with the contents of a single pot. In the year 1862, the Belgisn establishment of Sainte-Varin d'Oignies exhibited in London a plate of a size exceeding the last mentioned by twenty-six square feet, bnt, this mirror being cast with the contents of two pots, it showed marks which were produced by the line of contsct of the two streams.

Various Qualities of Iron.—It is a well known fact, that there is a great variety in quality snd character of pig, bloom and cast iron. When iron has passed into the form of steel, the ssme great differenciea exist in quality. The reason is eesily defined and understood by the iron worker. That iron is ever found pure, or made so by any ohsnge yet known, we do not believe. It is metal of various elements, and when a certain portion of each one predominates, the variation from the one not holding the same is at onoe noted.

The existence of an undne proportion of phosphoric acid, can be at once detected; for it imparts to the mass a great degree of brittleness aud shortness. The existence of carbon in small or large proportion gives to iron many changes; and it is remarkable how little of thia carbon is required to produce steel from iron.

It is curious to witness the changes produced by the variations of quality of carbon from one to six per cent. in the changes of thia metal from pig iron to other conditions. It ia wonderful to observe the entire difference in the quality of pig iron by careful anslysis. The varions proportions of silica, lime, alnmins, magnesia, manganese, sulphur, phosphorus, titantic acid, or other substances thongh principally or partially destroyed by the process of change, leaves their marked influence upon the metal ever after.—*Ex.*

Another Answer.—Mr. A. E. Holley gives a very sensible answer to the much discnssed question, "What is Steel," in the following lsnguage: "Steel is an alloy of iron that is cast while in a fluid state into a malleable ingot. Any radical nomenclature fonnded on chemical differences leads to endless mistako and confusion. If steel is defined as an alloy of iron contsining carbon enough to harden it when it is heated and plnnged into water, theu puddled iron, although laminated and heterogeneous in strncture, may not he steel, and the finest product of the crucible, although crystalline and homogeneous in structure, may not be steel. The fundsmental and essential difference between steel snd all other compounds of iron is a structural difference, and it is always eesily determined, while steel and wrought iron cannot always be distinguished by chemicsl anslysis. The same proportions of carbon, manganese, silicon and other elements msy exist in snd similarly effeot any malleable alloy of iron. Steel is, therefore, an alloy of iron which is cast into a malleable mass."

Raising Steam by Solar Heat.—Several inventors in different countries are attempting to ntilize the heat of the snn's rays, snd to construct a sun engine. Many people shake their head at this idea and ridicule the very idea of success. But they are certsinly unacqnainted with the stupendous force at disposal. To convert one pound of water from zero to steam requires 637 centigrade units of heat. The researches of men of science have proved that every square centimeter of the earth's surface receives not less than 231,675 centigrade nnits of the sun's heat annnally. Forty per cent. of this is absorbed by the surrounding atmosphere, and sixty per cent. reaches the earth. This gives seven centigrade units received per second on each centimeter, so that ninety-one squsre feet of the earth's surface would receive heat enough every second for the vaporization of one pound of water.

Device for Increasing the Flow of Wells. M. Donnet, a French engineer, has discovered a method of increasing the flow of wells, by closing the mouth as perfectly as possible, by means of a sheet-iron bell, through the top of which the tube passes which is attached to the pump. When the pump is worked, if more water is withdrawn from the well than naturally flows into it, the water-level is lowered, and a diminution of pressure is produced on the surface; this causes an increased supply of water to come in from the springs which feed the well, and the total dolivery of the well is permanently increased.

COMPARATIVE TABLE.

Our Weekly Stock Review.

WEDNESDAY EVE, July 2, 1873.

The stock Market tbis week bas evinced very little activity, tbe coming holidays occupying the public mind to an extent to lessen the amount of business. The feature of the week was the rise in Savage. On Monday last it closed at $163, an advance of $30 over previous days' sales. Savage is one of the most fluctuating stocks on the list and bas lost and made fortunes for many an operator. Consolidated Virginia has also shown some activity tbis week but nothing like what occurred a few weeks since. The market generally for tbe week has been uninteresting.

The members of the San Francisco Stock and Exchange Board bave appointed a "Trust Fund Committee," to be elected annually, in whose hands $30,000 is to be placed, to be loaned to members on nsual securities at current rates. It is thought that tho money will double itself in two years and a half. From the fund created in tbis manner $10,000 is to be donated to the families of every member that dies. The experience of the Board hitherto bas been that they lose a member every eighteen months, consequently, in three years they will lose two members, involving two donations aggregating $20,000; but tbe fund in that time will earn $35,000. Tbus, if a member leaves a wife and cbild, or children, the $10,000 will go to the latter. If no children, to the wife; if unmarried he may designate tbe beneficiary. If be dies witbont family, and witbont naming a person to receive the donation, none will be made. If deatbs sbould occur involving payments to an amount greater than the increase of the trust fund then a pro rata assessment will be promptly levied to meet the deficit.

This is a very good move on the part of the brokers and besides being a convenience to them when alive, the Trust Fund will benefit their families in case of deatb. The wbole amount—$30,000—has already been taken up and the proceeds will go to the Life Insurance Fund. It is said that should this experiment prove successful tbe balance of tbe entire surplus—$70,000—belonging to the Board will be converted in tbe same way.

As we go to press one day earlier than usual this week, on account of the holiday on tbe 4th, our regular weekly letter from the Comstock mines, did not come to hand in time for insertion.

On Friday last, the market was a little stronger than on the previous day; tbe feature, was the advance of Consolidated Virginia, which closed $12 ahead.

On Saturday, the market was not very active and business was quiet. At the close, Choller was $2 bigher; Yellow Jacket, $3; Ophir, $3. Meadow Valley fell $1.50; Eureka Con., $1; Overman, $1; Savage, $3; Con. Virginia, $7. In other prices there was no material change.

Mondays' sales were ilgbt, and fractuations of little consequence.

On Tuesday, the market was pretty strong, prices showing an advance. At close, Savage in particular, made a characteristic advance—$30, selling at $163; Hale & Norcross, rose $3; Con. Virginia, $3; Gould & Curry, $1. The Eureka, Grass Valley mine, has declared a dividend of $1, amounting to $20,000.

Mining stocks were in fair demand to-day. The Board adjourned over until next Tuesday and the wbole list was called at the morning session to-day. There was a further advance of $13 in Savage, which is doubtless due to the pending election. Compared with the rates yesterday, Segregated Belcher advanced $3, Consolidated Virginia, Golden Chariot and Yellow Jacket each $2, Belcher, Eureka Consolidated, Gould & Curry, Justico, each $1. Crown Point and Raymond & Ely each declined $2, Rye Patcb $1.50, and Newark $1.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

CALAVERAS COUNTY.

MOSQUITO DISTRICT.—Calaveras *Chronicle*, June 28: Tha main shaft in the Good Hope is now down 130 ft. Sinking now. Vein of good size; contains excellent ore.

Willett & Co. bongbt a portion of the Woodcock mine. Running tunnel on tbe vein. The Dolly Varden has pretty fair ore on dump. The vein averages over 5 ft. in thickness and presents better features than any other mine in the district. Shaft 100 ft. deep. San Bruno is driving tunnel.

WEST POINT DISTRICT.—The Pancbo will probably change hands in a short time. Developments on the Harris mine progress slowly. The ore yields considereble over expenses. Lone Star working 6 or 6 bands. The mine retes No. 1. Obio Consolidated hauling and crushing ore. Running levels and transverse drift to tap tbe vein. The mine promises to excasd the most favorebly expectations. S. Haskings is opening a bandsome vein near Skull Flat. The new saw mill of Wickham & Co. is completed. Lumber can now be had at very reasonable rates. Business brisk.

FRESNO COUNTY.

COPPER MINING.—Fresno *Expositor*, June 25: In the vicinity of Bnchanan Hollow, in this county, copper mining seems to be increasing in prosperity. Three mines are now in operetion near Green Mountain, from all of which excellent ores are being extracted. The names of the mines are the Green Mine, Green Mountain and Lone Tree. The last of these is being operated by J. M. Ault, Esq. We learn that he is taking ont a considerable quantity of ore, mnch of which assays 35 per cent. copper. The ores from the mine are being smelted at the furnace erected by Mr. Harry DeGroot, on Green Mountain, and the reguins shipped to San Francisco, where it sells for $525 per ton. The Green Mountain mine, worked by Harrey DeGroot, is yeilding splendid ore. A number of tons sbipped last month brought $100 per ton in San Francisco. The old Buchanan Copper Mine, which was started up about a year ago by James McMecham, Esq., is yielding more and better ore than ever before. It ranges from 16 to 35 per cent. Abont fifty tons of ore are shipped per month. Ten white men and fifteen Chinamen are now engaged abont the mine, but the working force is to be doubled, and then shipments of ore will be proportionately increased.

EL DORADO COUNTY.

OFFER FOR A PLACERVILLE MINE.—Mountain "Domocret," June 28: Edward Keegan, one of our pioneers, has a qnartz ledge in the heart of this city. He has stripped the croppings of one enormona ledge and tunneled on another near by. A few daya ago he was offered $10,000 cash down, by responsible San Francisco capitalists, for bis claim, bnt refused to take less than $17,000 for it.

NEVADA COUNTY.

Nevada *Transcript*, June 26: The Little York Gold Washing Company is the name adopted by the purchasers of the property of tha Little York Water and Gravel Mining Company. The new company is composed of English capitalists, and the property is a very excellent one. In addition to extensive gravel ranges, they bave first water right for two ditches from Bear river, and the second right on Steep Hollow, giving them first-rate water privileges. They are now running two sets of diggings by day, and supplying Dr. Alpin, wbo is running his claims night and day, and they have about 700 inches of water. We understand the prospects of the company are very encouraging.

RUSA LEDGE.—Grass Valley *Union*, July 29.—Kennedy & Co. have been working for some time on a ledge a short distance from the North Star mine. It was formerly known as the Russ Ledge, having been worked for a time, about the year 1859, by Colonel Russ, wbo left Grass Valley and finally located in the gold minea of Nova Scotia, where he died. Two satisfactory crushings bavo been made from tbe rock taken out. They are down on the ledge about 150 ft., and the rock is looking better as they sink apon it.

STRIKE.—It is rumored about the streets that a new and very rich strike in quartz bas been made in this district witbin a few days. The parties in interest are not yet ready to give public information, but they inform us that it is but a few minntes' work at any time to scratch out $10 or $16 worth of gold with the fingers.

THE ENTERPRISE MINE.—Nevada *Transcript*, June 28: The Enterprise Gravel mine is located in Buena Vista Slide, and the works are very complete. They have a 10-stamp battery, pumping, and hoisting-works, all in the most complete order. The incline is in three compartments, and is down 1400 feet. All the way above the bottom of tba incline they have gravel wbich prospects well, bnt they bavo not yet struck the main channel for which they are running. We underetand, however, that the Enterprise has paid expenses all along, and the yield will, no doubt, be largely increased when they reacb tbe main channel, which is known to run along under the ridge which they are washing.

PLUMAS COUNTY.

MINING NOTES.—Plumas "National," June 28: Metcalf and Haycock on Gopher Hill have nearly finished tbeir seasons' run of water. They have moved a large quantity of ground tbis season, and will be well remunerated for their toil. Morris Smith & Co., whose drifting claims are also on Gopher Hill, are doing well, and have been for some time. The Blackhawk Co. are cleaning up, and report says will make a good season's run. The Devil's Elbow Co. are working several men, with fair results. Low water is unfavorable, as it allows tailings to accnmulate. The Hungarian Co. are not piping at present, the Mill Creek water having been turned down the creek for the benefit of the farmers. The Superintendent, Mr. Goodwin, is working a few men, however, and as usual, taking ont lots of "kaleseek." Tha O'Neil Bros. have recently got some very favorable prospects in their drifting claims at Newtown. Judkins & Kingsbnry, of Newtown, have nearly completed their preparations, and will soon be taking out "pay grit." Bell still continues to get some fine prospects from his quartz claim near Elizabethtown. Leavitt is working a claim in Betsy Gulch, near Elizabethtown, and is making good wages. Heath & Co., of Argentine are still piping and the indications are tbat they will make a binge clean up. This claim we consider one of the best in the country. Dean & Steffe are doing a large amount of work at the montb of Squirrel Creek and have good prospects. Swan, Webster & Co., are also at work on Squirrel Creek, bnt we are not posted as to the results. The water bas been remarkably short, and nnmerous claims bave been idle. One or two good water seasons would develop a large number of claims, and make Plumas one of the formost mining counties in the State.

SAN DIEGO COUNTY.

Weekly *World*, June 21, says: About one week ago tbe Messrs. Young, Worth and Sheard struck an extension of the Golden Chariot, 6 miles south of that mine. The specimens from this ledge are of a very favorable character, and promises to equal the Golden Chariot in richness.

The developments of the Tom Scott are good, and promises to exceed anything before discovered, perhaps with the exception of the Golden Chartot. A joint shaft with the Eureka, which it adjoins, is being sunk and is already down 100 feet. As soon as water is struck they will put on an engine.

The Owen mine has let a contract to sink 25 ft, at $30 per ft., and the work is being pushed vigorously.

Good rock bas been struck in the Far West and the outlook is all that the owners could wish.

In the Victis mine three shafts are being worked daily and a great deal of rock is being taken out.

The San Nicolas mine, in the San Rafael District, cleaned up after a crnshing of 180 tons of rock, netting $1,200. Owing to the failure of water supply crushing has been suspended on this rock as also that of the Pueblo, Zapata and other mines.

TULOUMNE COUNTY.

T. M. BLUE GRAVEL CO.—*Independent*, June 23: Are turning out from 22 to 24 ounces of gold per day, and better prospects ahead.

A GOOD CLAIM.—On Thursday of last week Haynes & Co., wbo own a claim in Parsons' Ranch, Columbia, cleaned up after a 100 days' run, and obtained thirty-four pounds of gold—about $7,550.

GOLDEN GATE.—A few tons of rock from this lode was run through an arastra at Brown's Flat, recently, and under most discouraging circumstances, the machinery being out of order and mud water being used. The yield was over $10 per ton, even at that; 600 pounds of the same rock shipped below last week, and run through a mill, turned ont $28.11 to the ton, the average assay of pulp being $7.18. Sulpburets sent down at the same time, assayed $516.64 per ton. Mr. Long, the Superintendent, wishing to thouroughly test the vein, picked out parcels of the sulphurets—one in the slate, near the hanging wall, and one on foot wall, from neither of which anything was expected. The first, in the slato horse, where the lead is from 12 to 15 ft. in width, assayed $202.18 to the ton, and the highest assay lead was on the foot wall in the breast of the tunnel, which went $2,461.35 to the ton, and getting richer as the miners work in. The sbaft is now down to the tunnel, which is in on the veinsome 200 ft. below the surface. Tbe prospect ahead looks first-rate, better than ever.

PROSPECTORA.—Union *Democrat*, June 28: Quite a nnmber af persons during this month, have made trips into the mountains east of this place, for the purpose of finding silver-bearing leads. Large bodies of anow have prevented them from making anything like satisfactory explorations. The fact that silver-bearing ore was found last year in our county, makes many of the prospecting class uneasy, taxing their patience until such time as the snow will permit of a thorongh search. The parties that commenced opening a lead last fall, have made preparetions to resume work, with sanguine expectations that it will develop into a paying mine. A number of assaya made returned a bandsome per cent. of silver.

Nevada.

ELY DISTRICT.

AMERICAN FLAG.—Piocbe *Record*, June 22: The developments in this mine at a depth of 625 ft., still continue to improve in character. The vein metter at this point is the foll width of the shaft, the ore body being 2 ft, wide. The stopes are yielding the same amount of ore as heretofore. The mine is being prospected as rapidly as possible. Ore is being shipped daily to the Amador mill, which is doing good work.

PORTSMOUTH.—The Portsmouth mine is situated between the Alps and Montana, in a binge mass of croppings, the exact counterpart of those in wbich the main shafts of the Excelsior and La Paz mines are sunk. A perpendicnlar sbaft has been sunk to the depth of 72

(Continued on Page 12.)

California in the Ninth Census.

A correspondsnt of the *Bulletin* who has been extracting items of intersst to Californians from the ninth census, writes as follows concerning the mines: The censuses of 1850 and 1860 cannot be taksn as a guide in determining tbe increase of manufactures in California, as in other States, because mining was a chief elmsnt of the account then, and it, with quarrying and the fisheries, are left ont of the census in 1870, though given seperately in a form that the Commissioner of the Census himself pronounces utterly unreliable. The following table shows, inclnding the mining and fishery statistics in 1850 and 1860, and leaving them out in 1870, the manufactured products of the State of Californie.

1850 (including mining)	$12,862,552
1860 (including mining)	68,253,228
1870 (exclusive of mining)	66,594,552

In 1850 and 1860, the principal prodncts of California were from the mines. The wheelwright shops, where wagons were made and repaired, and the flour mills, were then prodncing something considerable for those days, hut nothing as compared to now. The vast other things that will be seen in a detailed table given below, have made Californie one of the great manufacturing States of the Union. Her mining industries, less by far now than in 1860, are stated (becanse no correct statement is obtained) leaving ont ths milled product, et a total of $8,281,623.

Cinnabar	$17,700
Gold, hydraulic mined	1,622,993
Gold, placer mined	2,646,174
Gold quartz	3,096,666
Gold and silver quartz	15,000
Silver quartz	83,100

Conflicting Estimates.

With regard to the prodnctions of gold and silver, however, the thousand difficulties surrounding the ascertainment of anything like a correct statement rsgarding it, make it almost impossible to obtain one under a system operated by the average censns enumerator. Professor R. W. Raymond, Commissioner of Mining Statistics, gives for thß year most nearly corrssponding to the census year, the gold and silver product of the United States, mined and milled, as follows:

California	$22,500,000
Nevada	14,000,000
Oregon and Washington	3,000,000
Idaho	7,000,000
Montana	9,000,000
Colorado and Wyoming	4,000,000
New Mexico	500,000
Arizona	1,000,000
All other sources	500,000
Total	$61,500,000

The csnsns for 1870, exclnding the valne added by milling, gives the gold and silver mining prodnct proper at $26,452,652 as follows.

Hydraulic	$2,508,531
Placer	7,266,613
Quartz	16,677,508

The Census Commissioner allows 45 per cent., as added by milling, and the result is that the two reports on gold and silver mining for the United States, including milling, stand:

Professor Raymond	$61,500,000
Census Commissioner	33,959,531

Commissioner Walker Defends His Statistics.

Commissioner Walker defends his statistics for 1870 ae against the seemingly great redncton as compared with the census of 1860, by showing that in the latter ceusus two-thirds or probably three-fourths of the amount of $24,163,170 then reported as the gross prodnct for gold mining, were based on estimates; that dnplicated production, resulting from the valne of the gold or silver qnartz being twice counted —once directly after being mined, and again after being milled, and even triplications of another class, that resulted from inclnding the assay and refining of gold and silver, all the valne thns reported having been included as bullion, and a portion of it having been twice reported; once as the valne of ore, and once again as bullion, and third as assayed or refined metal. In 1860, 5,000 of 7,042 gold mining establishments were not retnrued to tbe census office, but were estimated for. The census of 1870 does not in this respect contain any estimates. For that reason the amounts eeem surprisingly emall. Taking into cousideration the admissions made in both the eighth and ninth census reports, the belief is irresistible that so far as gold and silver mining are concerned in the census, both of 1860 and 1870, the statistics are so nnreliable tbat the results attained are not only provoking to contemplate, bnt are almost as bad as none at all. This fact should not, however, detract from tbe credibility of the entire census, becanse the statistics relating to population, mortality, manufactnres, etc., are, ae a rule, of inestimable valne, tbe best the United States ever had, and reflect great credit upon the Commissioner.

School Ship.—It is proposed to endeavor to secure the Flag Ship "California," recently condemned, and now lying in onr harbor, as a "school ship" for boys wbo would otherwise be candidates for the Indnstrial school. She is admirably adapted for the purpose and it is to be hoped that efforts of the gentlemen who have the matter in hand will be successlul. This is the manner in which old ships are disposed of in England and the results have been eatisfactory.

The mills on the Carson River are running to their full capacity, and there is plenty of water.

Mining Schools in Germany.

In all parts of Germany there are schools for the purpose of imparting the theoretical as well as practical knowledge necessary to become a skillful and efficient mine mansger. These are open to all classes, even the poorsst, and the terms of admission are snch that the latter can avail themselves readily of their advantagss.

Two of the most noted are at Saarbruck and Siegen. In ths first locality, ths mines are worked by the German Government, and the school is snpported by the State. The school at Siegen draws yearly abont $600 from the Government, and $1,750 per annum are subcribed by the colliery owners, and these sums, augmented by a bequest of $450 per annum, represent the income of the Institution. The scholars pay nothing, bnt, on the contrary, receive a trifle for lodging whilst attending the course. The teachsrs, five or six in number, receive $950 per annum among them; bnt they have other sonrces of income. Abont $950 is expended on the pupils. $200 for apparatus, and the whole expenditure reaches abont $2,500. The programme of the Royal school, at Saarbruck, sets forth that the objects are "to prepare young miners, who bad had sufficient practical training, for the offices of mining surveyors and managers, and accountants, through instructions in such branches of study as bear on the above occupations." The instruction in the preparatory schools is rather to revive in the minds of the pupils their primary training, and in the preparatory schools the instruction does not interfere with the yonths' labor. Ths only additional snbjects they stndy are the rudiments of geometry and the construction of machines. At Saarbruck, there are ssventy-five scholars; at Siegen, about fifty. Ths subjects of instruction are, for the lower classes, writing, drawing, aritbmetic—especially the arithmetic connected with mining (mathematics)—mschanics and mechanism, surveying, chemistry, and geology. Tbe snbjscts are the same for the npper classes, bnt, as might be expected, the scholars spent less time in writing and drawing, and more in studying mining and machinery. In regsrd to mathematics, a practical turn is given to the instruction, the lower class studying msnsnration, leveling, &c., and the upper class trigonometry applied to the measnring of angles (for ascertaining the heights of objects), the making of estimates, whilst the elements of algebra and the use of logarithms are tenght to the npper and lowsr classes. To illustrate the laws in geology, there are excellent meps and models, showing tbe position of the strata and the situation of the beds of ors. The greatest number of hours are given to surveying and drewing plans, ths study of the machinery, and the science of working mines.

What is called mining science inclnded instruction in the various gases found; bow they were found; how to get rid of them; and how to recover those affected by them; the best kind of ventilation; the different kinds of roads, shafts, pumping apparatus; and the best way of preventing accidents. Mere theoretical knowledge of these matters would be of little moment, but the etudents in these schools are all practical miners taken out of the pits. Before they could enter they must have worked two years in the pits, and the average was five years' service in the mines. To such as these, instrnction as to the causes and principles of everything they saw around them must, of course, be productive of good, and would enable them to be better guides and foremen to the other miners.

Is there not in this a hint to our people? As much as we may try to disguise the fact, "knowledge is power," and the workman who can do a thing, and tell why he did it, is the superior of the one who has only the practicel acqnaintance with the art. Onr workingmen realize this in practice, at least, and there are hnndreds and tbousands of the children of the most ignorant laborers who are to-day the superior of their parents in knowledge, simply becanse the good, sterling, common sense of the laborer tells him that in the long run bone and brawn alone will not conquer, but brain with these will. It is these that will bring bigher wages and a better culture, and do vastly more to improve the condition of the laborer than anything else possibly can.—*Am. Manufacturer.*

Quicksilver.—An Easterv paper remarks: "The Treasurer of the Qnicksilver Mining Company etates that an arangement has been made between it and the New Idrie Company to produce dnring the year ending April 1, 1874, only 34,000 flesks, the Quicksilver being restricted to 24,000, and the New Idria to 10,000 flasks. By the arrangement each company receives the market price of quicksilver instead of a price determined by contract as heretofore. Already the receipts of the Quicksilver Company have been about $1,000 per day larger than those under the last contract the company had. The Quicksilver Company have already paid off $440,000 of their first mortgage honds dne June 1, being all so far presented. Tbe entire amount maturing June 1, was $500,000." This limitation of prodnction is an old form, applicable years ago when the supply far exceeded the wants of the market, but is now, when the prodnction is, with difficulty, half that quentity, quite inapplicable. Tbe whole prodnction, much or little, is sold by the agent, Tbomas Bell, Esq.

Bad Speculations.

From time to time we notice the organization of companies, with large capital, at Pittsbnrg, St. Louis, Chicago and other places for the purpose of erecting reduction works of great capecity to treat ores from Utah, Idaho, Montana, Colorado and other mining regions. Already works are in operation in ssveral of the large cities, and there are reasons for believing that tbey are not financially a snccess.

We cannot understand why men having capital to invsst in reduction works should wish to invest their monsy in cities hundreds of miles away from ths mining regions, where the freight charges on crude ores are so enormously high. It seems to us the sheerest folly to expend hundreds of thousands of dollars in the erection of works at such points, when there is no reason why they may not bs erected in the vicinity of the mines, at least so far as Utah is concerned.

It is no difficnlt matter to foretell that in the early future the vicinity of Salt Lake will be the great center for reduction works of all kinds. The reasons for this are, that it will be the great railroad center of the interior conntry, thet fnel is both cheap and abundant, as also are fluxss, that labor is not higher than elsewhere and, moreover, ws are situsted right in tbe heart of the mineral country, with narrow gauge communication to all tbe principal mining camps. This being the case, Selt Lake City offers far supsrior advantages to any of the Easterv cities for the expenditure of capital for reduction works, and Eastern men would do well to reconsider many of their proposed plans and invest their money where it will yield the best interest. Looking at ths subject from our stsndpoint, we believe that, of all the works now ersected in the East for ths treatment of ores from the interior country, but one or two will remain engaged in tbe bnsiness at the expiration of two or three years. Gentlemen, come to Utah and examine the field, and you will all reach the same conclnsion.—*Salt Lake Tribune.*

The Coal Fields of China.—There has long been much talk of ths extensive coal fields within ths Chinese Empire, but nothing definite had been published concerning them. M. Louis Stranss, Consul for Belgium at one of ths Chinese ports, now furnishes the *Independence Belge* with the following figures as to the extent of the coal formetion in the northern provinces of the Empire:

	Sq. miles.
In Chiensi	9,000
In Chansi	28,000
In Tchyli	30,000
In Chin-King	20,000
	87,000

In addition to these there are the coal deposits of Formosa, an island off the Chinese coast, of 10,000 square miles, making the total coal area 97,000 eqnare miles. The United States is the only otber nation which has anything like the same extent of coal lands. The area in this country is estimated at 120,000 square miles. Tbe 12,000 sqnare miles of coal deposits in the United Kingdom of Great Britain and 18,000 in its coloniel dependencies, make an insignificent showing in comparison with the vast deposits of Chine. Yet with all this known mineral wealth, the Chinese, who have seen the value of coal in the United States and the Anstralian colonies, have hitherto shown no signs of working their mines at home. It has however recently been said, bnt it is only a rumor, that the Court at Pekin is favorably disposed towards the introdnction of the rail roads into the Empire. Perheps the Mongolian mind may yet awake from its long sleep of thousands of years, to realize the value of these deposits. It may find more profit in keeping its coolie labor at home, providing cheap coal for the accessible markets, than in seeking to take the place of Africa in snpplying slaves to the aristocratic nations.

Mines on Mexican Grants.—A correspondent who has heerd of the discovery of some metalliferous veins on the line of the railroad between Saucelito and San Rafael, inquires of the *Alta* how he can acquire a valid miner'e claim there. The answer is, that his best plan is to bny the Mexican grant, for all the land there is held nnder that title. Mexico in her grants reserved the title to all the precions metals, and miners could occupy any portion of a rancho necessary for mining operations, bnt the United States Snpreme Court has decided that a Federal patent conveys an absolute title to the land and all that may be found in it; and, therefore, takes the mines as well as the soil. Under this decision, the grant-owners like to carry the survey up into the barren mountains in places where gold abounds.

The Newspaper Press.—A collector of statistice informs ns that California ranks fonrth in the nnmber of her daily papers. New York heads the list with 96 dailies; Pennsylvania has 70; Illinois, 37; California, 31. Ohio has 27, and Massachusetts 25. There are 647 daily, 96 tri-weekly, 101 semi-weekly, and 9,175 weekly papers published in the States and Territories.

Wonderful Mine.—Here's an item for sanguine miners who find every thing wanted in one piece of ore (when they want to sell.) The *Hickory Press* says a wonderful mine has been discovered by Colonel J. W. McElrath in the South Mounteins, Virginia, whicb contains mica, silver and assafoedita with some indications of petroleum oil gas.

An Important Discovery.

The White Pins *News* says: It has long been our wish to speak of the discovery of stone coel at Pancake, bnt we have refrained from doing so, feering tbat a premature *expose* might injure the prospects of ths owners of the property. Now, however, that the fact of the existsnce of good coal in quenties has been dsmonstrated, as we are informed, beyond a doubt, it has bscome a matter of pnblic interest to all people. The mine where this valuable discovery was made is situated on the Pancake range of mountains, fiftsen miles from Hemilton, in the immediate vicinity of J. D. Sullivan's old station. Some four years ago ths latter gentleman, then living on his ranch at the place mentioned, thought he could trace indications of the existence of coal, and at once commenced sinking a shaft, which he finally abandoned, until Col. A. Lewis, an energetic mining gentlsman, well known in White Pine and vicinity, in company with Fred. Berrows, were attracted to the spot, and, becoming convinced of the presence of coal at that place, snterad into arrangements with Mr. Sullivan to commence work on the same. Col. Lewis at once proceeded East, and after considerable difficnlty snceeeded in interesting some parties there in his snterprise, and work has been prosecuted steadily since. To the gentlemen now engaged in the development of this valuable property is due great credit for their persistsnt efforts against much opposition from practical miners and theoretical scientists, who never acknowledge the presence of anything until some other parties make discoveries; then they know all ebont it and declare that the formation of the country proves unmistakably the sxistence of the article sought for. Science is well enongh, but had Col. Lewis and his compenions listsned to advice from its devotees, they would never have made the discovery of marketable coal in Pancake range. No doubt can possibly exist of the value and extent of the mine, as, we are informed, thet at a depth of 200 feet a vein of four feet eight inches has been exposed, which can be readily extracted. The locality wherein this discovery is made renders the valne of the property greater from its contiguity to the smelting furnaces of Eureka, and the valley through whicb ths line of railroad is proposed to be built. When all arrangements are complete, a large force of msn will be sst at work on this mine, and we csn confidently expect to see coal in use, both for domestic and smelting purposes. The owners of the mine are natnrally much elated at the prospect before them, and with much truth, believs that their possessions exceed by far the richsst silver mine in Eastsrn Nevada.

Slate and Coal Discovery.—It is rnmored that immense bodies of slate and coal have been recently discovered at the point of the mountain west of Salt Lake City. The ledge of slate is pronounced by those who say they have seen it to be of fine quality, and splits off in large and very tbin bodies even at the croppings.

Should the discovery turu out to be as reported, it will be one of the most valuable and useful ones yet mede.

Mexican Mines.—A correspondent writes from Mexico as follows: The mines are now worked with mucb vigor in every part of the country; the goveruor of Aguas Calientes, Chavez, formed a company to reopen the old mines of Alta Pamira and No Pensada, which had been abandoned more than twenty years. Tbe mints are also kept busy, and in April, that of Gnanajnato coined $350,000 in gold and silver; that of San Luis, $87,000, and others in proportion.—*Call.*

San Rafael Mines.—The San Diego *World* has the following regarding the San Rafael mines: The San Nicholas mine cleened up a few days ago, after a crushing of one hundred and eighty tons of rock, netting some twelve hundred dollars. This mine is owned by the Messrs. Mendelson, Leon, Merrible and others. The ten-stamp mill attacbed to the San Nicholas, with water would have been kept bnsy straight along crushing its own rock, and that of the Pueblo, Zapata, and other adjoining mines. Work is at present enspended on the Trindad mine.

Big Team.—The Enreka *Sentinel* of Jnne 17th says: "There were 80,113 pounds of bullion ehipped on Prichard's mammoth team of twenty-four mules and six wagons yesterday. The item should be copied in the Eesterv papers, and half of their readers would say the reporter lied; that there never were so many animals, wagons and bars of bnllion in one string.

Mineral Hill Mines.—A dispatch says: The mines in this district are looking much better than for the past few months. Several cleims are now being worked that have been lying idle for more than a year. In the adjoining district lately organized, known as Hardscrabble, the mines are steadily increasing in richness. Business has an npward tendency.

The mining tunnel to be run from Black Hawk to Middle Park, Colorado, will cnt through a spur of the Rocky Mountains and be 12 miles in length, when completed. It will probably also be nsed for railway purposes. The money is furnished by English capitalists.

Domestic Economy.

Cooking as a Science and an Art.

At the International Exhibition in London, Mr. Buckmaster lectures on cooking. He has abundanct and efficient assistance, and all the materials and accessories he needs for the complete illustration of his subjects. Having mounted his rostrum, where a variety of objects have been arranged to his hand for illustrative purposes, he is waited npon hy four dapper female cooks, appropriately attired, wh watch his eye and hand, and hang npon his lips, sniting their actions to his words. He vindicates his mission manfully as a teacher of practical cookery, and contends that there is greater dignity in a housewife, or a woman of any class, being ahle to cook economically a wholesome, palatable dinner, than in heing ahle to fashion and mimpulato flounces. His object, he stated, was not to show how to prepare costly, high-class dishes, but to point out defects in onr domestic cookery, and to suggest remedies.

Aided by his assistants he proceeds to prepare various dishes, which he subsequently passed around among the audience, who test their qnality. Meat is put on to steam and boil, vegetables are scraped and sliced, a few words being interspersed concerning their respective characters and qualities, and the manner in which they should be prepared and manipulated. At a late lectnre he prepered a French *pot au feu*, an excellent and economical dish. Some few pounds of meat and bones were placed in a stew pan and covered about two inches over the top with pure, soft water. An onion ie next peeled, and put down to roast. Another onion is peeled and garnished with a dozen oloves, stnck ronnd in center. The other vegetahles are then scraped and sliced. These consisted of two carrots, a parsnip, two tnrnips (these can scarcely he peeled too thickly, while potatoes cannot be peeled too thinly, as far as the mere cuticle goes), half a head of celery, a leek, and for a flavoring bouquet, a sprig of marjoram, another of thyme, a small hunch of parsley, two hay-leeves, and a clove of garlic. The sancepan, which has been simmering on the cooking-stove, is then carefnlly skimmed, and the carrots added ten minutes before the other vegetables, the other ingredients being a dessert-spoonful of salt, a teaspoonful each of whole pepper and of allspice; the whole is then put to simmer for three or four hours,but should not he allowed to boil. The time required for this dish, requires that it should be cooked at leisure after the lecture, and warmed up for the next day's audience.

In referring to the aims and objects of the school, Mr. Buckmaster quotes the proverh, "God sends meat," but another party "eends cooks." His numerous and respectable audience relish his sonp, beef, and omelettes, and his lecture, too highly to enspect for a moment that he or his assistants were in the service of the said other party; and althongh all present might be in accord in applying to them the adjective clever, not one, we feel assnred, dream of attaching the snhstantive.

Kitchen Furniture.

Never have dark furniture for a kitchen. It shows the dust much more than light, and requires donble the care. Never have extra shelves, mantels, etc., painted dark if you can help it. If it is your misfortune to have dark paint and furniture, wipe it once in a few days with a damp cloth, and have it varnished often.

Have your sink in a convenient place, but never under a window if yon can avoid it, as mnch work is cansed by greasy dishwater spatteiing npon the windows as it necessarily must. Back of your sink nail up a piece of varnished paper, and then you can with a wet cloth remove all spots that would soon spoil room paper. If yon are so fortunate as to have a sink room, have it papered and then varnished well all over, as fly tracks and every spot can be wiped off. The sink should he lined with zinc, nailed ouly around the edges, ss nails upon the bottom rust and wear through, allowing water to run under the sink, thereby causing the boards to rot.

Good zinc can be kept nice and hright by scouring once in a week or two with sand, and rubbing all over once or twice a day with soft soap, scalding and wiping dry.

At one side have a place to put your water pail on, which always dsy and night keep covered; an uncovered water pail is a slack thing. Nailed npon the back side of the sink, have a little box perforated throngh the bottom, to keep hard soap in, and if yon have no better place, castile soap and a piece of pumice stone to remove stains from your hands. Your soft soap keep under the sink, which I take for granted is boarded np, with a door where yon pnt your pote and kettles, board to sconr knives upon, sand, etc., etc., and which place should be kept as neat as your sitting room. Just over the sink have a narrow shelf with holes throngh, to set your common tumblers npon when washed and rinsed, that they may drain and dry, thus saving the time and labor of wiping them with a dry cloth.

At the other end of the sink, have a narrow strip nailed np to set your kettle cricket on; of these you should have two, one to set your kettles on when washing and cleaning them, and which should be kept under the sink, in some odd nook—the other should be smaller, and only be nsed to set the tea kettle, etc., upon when filling, and therefore must be kept handy and clean, so if you should be sick with a headache, pain in your side, or any little trifling thing, and shonld ask yonr kind husband to fill the tea kettle, he would take the cricket down to set it on, instead of setting it in the sink—thus causing you more labor than it saves which he would be sure to do were the cricket nnder the sink, or so black and nasty, he could not touch it without soiling his hands.

And last but not least, have a light rack made of strips of wood an inch wide, an eighth of an inch thiek and a foot long, nailed over one another, making a rack a foot square, with both sides alike, to put in your sink to turn dishes upon while washing, thus keeping them from tonching the sink, which is liable to he greasy and dirty, and draining them so they will wipe easily.

Yon may think, fair reader, that it takes considerable to furnish a sink to suit my taste; hut every one of these things are around my sink, and not one would I dispense with, neither will you, after having seen how convenient they are.—*Ohio Farmer.*

Useful Information.

The Eye of an Eagle.

The eyes of all hirds have a peculiarity of structure which enables them to eee near or distant objects equally well, and this wonderful power is carried to the greatest perfection in the hird of prey. When we recollect that an eagle will ascend more than a mile in perpendicular hight, and from that enormons elevation will perceive its nnsnspecting prey, and pounce on it with unerring certainty; and when we see the same birds scrutinizing, with almost microscopic nicety, an object close at hand, we shall at once perceive that he possesses a power of accommodating his sight to distances in a manner to which our eye is unfitted, and of which it is totally incapable. If we take a printed page, we shall find that there is some particular distance, probahly ten inches, at which we can read the words and see each letler with perfect distinctness; but if we move this page to a distance of forty inches, or hring it within a distsnce of five inches, we shall find it impossihle to read it all; a scientific man would therefore, call ten inches the focus or focal distance of onr eyes. We cannot alter this focus except by the aid of spectacles.

But an eagle has the power of altering the focus of his eye just as he pleases; he has ouly to look at an object at the distance of two feet, or two miles, in order to see it with perfect distinctness. Of course, the eagle knows nothing of the wonderful contrivance which God has snpplied for his accommodation; he employs it instinctively and because he cannot help it. The hall of his eye is surrounded hy fifteen little plates, called sclerotic bones; they form a complete ring, and their edges slightly overlap each other. When he looks at a distant object, this little circle of bones expands, and the ball of the eye heing relieved from the pressure hecomes flatter; and when he looks at a very near object, the little bones press together, and the hall of the eye is thus sqneezed into a rounder or more convex form; the effect is very familiar to everybody; a person with very round eyes is near-sighted, and ouly sees clearly an object that is close to him; and a person with flat eyes, as in old age, can see nothing clearly except at a distance; the eagle, hy the mere will, can make his eyes round or flat, and see with equal clearness at any distance.

Interesting and Useful Facts.—A bell rung under water returns a tone as distinct as if rung in the air.

Stop one ear with the finger and press the other to the end of a long stick, and if a watch he held at the other end of the wood, ticking will he heard, be the wood a stick ever so long.

Tie a poker in the middle of a strip of flannel two or three feet long, and press your thumbs or fingers into your ears, while you swing your poker against an iron fender, and you will hear a sound like that of a heavy chnrch bell.

These experiments prove that water, wood and flaunels are good conductors of sound, for the sound of the bell, the watch and the fender passes throngh the water and along the deal and flannel to the ear, and excite in ns the sense of sound. Sonnd of all kinds, it is ascertained, travels at the rate of fifteen miles in a minute. The softest whisper travels as fast as the most tremendons thunder. The knowledge of this fact has been applied to the measurement of distance.

Snppose a ship in distress fires a gun, the light of which is seen on shore, or by another vessel, twenty seconds hefore a report is heard, it ie known to be a distance of 20 times 1,143 feet, or a little more than four and a half miles.

Phosphorus.—Red amorphons phosphorus, under the influence of solar heat, as does charcoal, has the property of ahsorhing many substances without acting chemically npon them, as rosaniline, iodine, sulphur. Pulverized phosphorus agitated in a solution of iodine in bisnlphate of carhon or rosaniline in alcohol, absorbs the iodine or the rosaniline, leaving the solntion colorless. These facts are pnblished as the result of the labors of M. Testini.

Good Health.

Premonitions of Consumption.

Somebody asks if it is possihle to tell thet a person is predisposed to consumption; if it is true that one shows hy an outward appearance whether he will, nnder bad hygiene, be more likely than his neighbor to get the disorder. Most certainly it is, to a great degree.

A child who has a thin, delicate, light skin, light hair, light, prominent and speaking eyes, who grows rapidly and is plnmp and fat, who ie precocions and over smart, is the one who it may be suspected is consumptive. That child who, in his or her mental and moral nature promises most, as its parents view it, is most likely to have consumption; the brain elements which have to do with good morals, good feelings and mental acumen, are those which in consumptive children are most apt to be overgrown.

Very early such children usually manifest a dislike for fatty foods; this symptom is very general, occurring through life in more than half the persons who have the disease, and being observed in nearly all in whom the disease is either incipient or confirmed. An habitnal disrelish for fat by a young person is sufficient to arouse a suspicion of tuherculons tendency. The dislike for this particular article of diet is occasioned hy an inability to digest it, not from any so-called freak of taste; rather the taste is determined by the powers of the system.

The inability to digest fat is a kind of dyspepsia, and somo form of dyspepsia exists in nearly all cases of consnmption. Usually, there is with this failure of digestion an annoying eructation of acid from the stomach, that has with eome given it the name of acid dyspepsia. In not more than ten per cent. of cases does tuherculosis occur without heing preceded hy some sort of indigestion, albeit ouly comparatively a few cases of dyspepsia occur in consnmptives.—*Maine Farmer.*

Women's Legs.—Here is eomething from the *Book of Beauty* that is strictly local here or anywhere else. Women should read it:

"A handsome leg is a rarity, we had almost said an impossihility, among American women. The reason of this is the place where they wear their garters. No French woman, no English woman of cultivation, now-a-days wears her garters helow the knees. It is ruinons to the shape of the calf. More than this, it has serious consequences of another kind. The principal vein of the leg, *vena saphrenabrevis*, runs just heneath the skin until it nearly reaches the knee, when it sinks hetween the muscles. Now, if this is constricted at its largest point hy a tight garter, the blood is checked in its return to the heart, the feet are easily chilled, and more liahle to disease; the other veins of the leg are swollen into hard blue knots, become varicose, as it is called, and often hreak, forming ohstinate ulcers. This is a picture which a physician sees nearly every day. With the garter fastened above the knee all this pain and deformity is avoided, bnt it is still better to wear no garter at all, and to suspend the stocking by tapes around the waist. In this case, however, a well-fitting stocking is needed."

Ammonia in Whooping Cough.—A writer in the British *Medical Journal*, states that in cases of whooping cough in the last stage—that is, after the third week—he has had one ounce of the strongest liquid ammonia put into a gallon of hoiling water in an open pan, and the steam kept np by means of half a hrick made red-hot throughout, and put into the boiling water containing the ammonia, the pan heing placed in the middle of a room into which the patients were brought as the ammoniated steam was passing off. This method, he says, was nsed in the evening, just hefore bed-time; and it proved so efficacious in abating the spasmodic attack, and after three or four days terminating the malady, as to establish, beyond any donht, the great value of this mode of inhaling ammonia as a therapeutic agent in tranqnilizing the nervous system in the whooping cough.

Wearing Flannel.—The majority of people are not aware of the heneficial effects of wearing flannel next to the hody, hoth in cold and warm weather. Flannel ie certainly not so uncomfortahle in warm weather as prejudiced people believe. Frequent colds and constant hacking coughs have left me since adopting flannel garments. There is no need of great hulk abont the waist, which condemns the wearer of flannels with those who prefer waspwaists, always fastening at the hack. There are scarcely any of the had effects of sudden changes of weather felt by those who wear flannel garments, and all mothers especially should endeavor to secure such for their little people, in preference to all those showy outside trimmings which fashion commends.

Nature of the Pain from Burns.—It is the common opinion that persons severely burned suffer the like pain with those who are slightly injnred hy fire; bnt such is not the case. Instead of experiencing a hurning sensation, they suffer from a feeling of coldness; the hlood heing driven from the surface of the body to the heart, lungs, etc.; and persons that die from injury by fire, suffer in somewhat the same manner with those that are frozen to death.

Eating When Exhausted.

When the strength or nerve power is already worn out, or nsed np, the digestion of food only makes a fresh demand npon it, and if it be nnahle to meet the demand, the food is only a burden upon it, producing mischief. Onr bodies have been compared to steam engines, the food being the fnel and the steam produced the nerve power. The analogy holds good to a certain extent. If, when the eteam is low, hecanse the fire is low, you pile in too fast a quantity of coal, you pnt out your fire, and if you have depended upon steam power to fan your fires, that is also extinguished. Beyond this the comparison fails. You may clean ont your furnaces and begin again, hut in the body the consequences of this overloadingare dangerous and sometimee fatal. No cause of cholers is more common than eating freely when exhausted. The rule should be to rest for a time, and take some simple refreshment, a cup, or part of a cnp, of tea, a little broth, or even a piece of bread—anything simple and in small amount, just to stimulate the stomach slightly, and begin to restore its power. After rest, a moderate quantity will be refreshing. Never eat a full meal when you are exhausted. Take first a small quantity of anything simple which may be handy, and rest. Then, after a time, proper food will be a blessing, not a hurden. The fires will burn, the steam will be up, and yon can go on your way safely. It is not amiss, in this connection, to say that children would avoid many a feverish night and many an attack of disease, if mothers would follow this rule.—*Ex.*

A Healthy City.

It appears from the following table, compiled from the Censns returns of 1870, that with the exception of Valparaiso, San Francisco is the healthiest city on the continent. The figures show the number of deaths in each 1,000 inhabitants for the year:

Valparaiso (Chili)	16	Boston	30
San Francisco	17	New Orleans	30
St. Louis	20	Newark	31
Cincinnati	20	Halifax	31
Baltimore	25	New York	32
Philadelphia	26	Savannah	36
Chicago	27	Montreal	37
Brooklyn	28	Memphis	46

There is no donbt that the summer winds, that cause so mnch discomfort and annoyance, and provoke so many animadversions by residents of San Francisco, perform a very important mission in bearing away the malarious elements, which would otherwise poison the air and propagate disease in this city. The above showing is most gratifying to Californians.

Cooling off Suddenly when Heated sends many of our farmers' yonth to an early tomh. It is often a matter of surprise that so many farmers' boys and girls die of consumption. It is thought that ahundant exercise in the open air is directly opposed to that disease. So it is; hut judgment and knowledge of the laws of health are esential to the preservation of health under any circumstances. When overheated, cool off slowly—never in a strong draught of air. Gentle fanning, especially if the face is wet with cold water, will soon produce a delightful coolness, which leaves no disagreeable results.

Common Sense.

There is a chilly, disagreeable article, called common sense, which is, of all thinga most repulsive and antipathetical to all petted creatures whose life has consisted in flattery. It is the kind of talk which sisters are very apt to hear from brothers, snd daughters from fathers and mothers, when fathers and mothers do their dnty by them! which sets the world before them as it is, and not as it is painted by flatterers. Those women who prefer the society of gentlemen, and who have the faculty of bewitching their senses, never are in the way of hearing from this cold matter-of-fact region; for them it really does not exist. Every phrase that meets their ear is polished and eoftened, gnarded and delicately turned, till there is not a particle of homely truth left in it. They pass their time in a world of illnsions; they demand these illnsions of all who approach them, as the condition of peace and favor. All persons, as a sort of inetinct, recognize the woman who livee by flattery, and give her the portion of meat to which she is entitled in dne season; and thns some poor women are hopelessly buried, as suicides nsed to be in Scotland, under a mountain of rubbieh, to which each passer-by adds one stone. It is only by some extraordinary power of circnmstances that a man can be fonnd to invade the sovereignty of a pretty woman with any disagreeable tidings, or as Jnnine says, "to instruct the throne in the langnage of truth."—*Mrs. H. B. Stowe.*

If thine enemy wrong thee, bny each of his children a drnm.

MINING AND SCIENTIFIC PRESS

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Arctic Travel and Adventure, Page 1. California Gravel Mines; Our Natal Day; The Hamilton Fire, 8. Accidents in Mines; Concentration of Ores; The Virginia Calamity, 9.

ILLUSTRATIONS.—The Whaling Fleet in the Ice, Page 1. Wren's Ore Concentrator, 9.

CORRESPONDENCE.—The Vienna Exposition, 2. Arizona Mines; The San Diego Mines; West Point Mines; Numbering or Classifying the Comstock Mines, 2.

SCIENTIFIC PROGRESS.—Rotation of Liquids; Practical Use of the Carbonic Acid Resulting from Fermentation; Percolation of Gases; Departure of Plants from their Original Types; Saponification; Scientific Prize-Award, 3.

MECHANICAL PROGRESS.—A Valuable Invention—Enameled Brick; Progress in the Manufacture of Mirrors; Various Qualities of Iron; Another Answer; Raising Steam by Solar Heat; Device for Increasing the Flow of Wells, 3.

MINING SUMMARY from various counties in California, Oregon and Utah, 5-12.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 4.

DOMESTIC ECONOMY.—Cooking as a Science and an Art; Kitchen Furniture, 7.

USEFUL INFORMATION.—The Eye of an Eagle; Interesting and Useful Facts; Phosphorus, 7.

GOOD HEALTH.—Premonitions of Consumption; Women's Legs; Ammonia in Whooping Cough; Wearing Flannel; Nature of the Pain from Burns; Eating When Exhausted; A Healthy City; Cooling off Suddenly when Heated; Common Sense, 7.

MISCELLANEOUS.—California in the Ninth Census; Schpoi Ship; Mining Schools in Germany; Quicksilver; Bad Speculations; The Coal Fields of China; Mines on Mexican Grants; The Newspaper Press; Wonderful Mine; An Important Discovery; Slate and Coal Discovery; Mexican Mines; San Rafael Mines; Big Team; Mineral Hill Mines, 6. Common Sense, 7. Consumption of Sugar; Farmers' Anti-Monopoly Movement; Hoisting Machinery in Salt Lake; Gold Diggings; The Wheat Crop; Working Low Grade Ores; Assyrian Research; Madder; Something about the Carson River; The Garibaldi Ledge; A New Chlorinizing and Desulphurizing Furnace; A Cheap Paint, 10.

NEW BANKING ESTABLISHMENT.—A new bank commenced business in this city this week called the Anglo-California Bank, (limited,) successors to I. Seligman & Co. The San Francisco office is at 412 California street, and the London office at No. 3 Angel Court. The authorized capital stock of the institution is $6,000,000, of which $3,000,000 has been subscribed and $1,500,000 paid in; the remainder is subject to call. The Directors in London are Hon. Hugh McCulloch, Wm. F. Scholfield, Reuben D. Saseoon, Isaac Seligman and Julius Lington. The San Francico managers are Richard G. Sneath and Ignatz Steinhart. Mr. Seligman is well known as a succeesful banker and Mr. Sueath ae a snccessful businese man alive to the leading interests of San Francieco. The bank is prepared to open accounts, receive deposits, make collectious, to buy and sell exchange and issue lettere of credit available throughout the world, and to loan money on proper security. The stock of this bank being held by leading bankers and capitalists of Europe and America, the hauk will have facilities in the registration abroad of State, municipal and other securities upon favorable terms.

COAL IN SAN FRANCISCO.—It is said that the company formed in London to purchase the Newport Coal mine at Coos Bay, will pnt on a line of steam colliere between the Bay and San Francisco. It is believed that thie coal can be offered by the cargo in San Francisco for seven or eight dollars a ton. During the past winter it sold from $14 to $15, retail.

LOW GRADE ORES.—The Georgetown *Miner* states that work re-commenced on the Mendota lode (Sherman Mountain) some time ago, and it is now turning out some fine looking lead ore, which, owing to the markets now existing in Denver and Golden for low grades, can be moved with profit.

California Gravel Mines.

We Californians boast, and justly too, of the vast resources of our State; we write, talk and sing of its wonderful products, both agricultural and mineral; we predict its magnificent future in the coming years, and yet few of us really know what its resources are, or what its prospective value is. We are all acquainted with the fact that five or six hundred thousand people are annually adding millions of dollars to the wealth of the world, but few realize what might be done if ample capital and intelligent enterprise were applied to improve and develop its hidden wealth.

Any one who will take the trouble to spend a few months in exploring some of the mining counties of the State, will find that one of the most important brauches of our industry has been very much neglected; we allude to gravel mining. A friend of ours, who has recently made an extended tour through the mining counties of the State, furnishes us with some interesting statements, concerning the localities in which gravel mining is being prosecuted to the greatest extent. Although there is more being done in this line than is generally known, yet there is a vast region of country stretching in an almost continnous line from the lower end of Mariposa to the upper end of Trinity county and many miles in width, covered with auriferous gravel that only awaits the application of capital and intelligent direction to astonish the world with its production of gold dust, to say nothing of the nnmerous gold quartz, copper, coal, etc., which abouud throughout this mineral belt.

There seems more activity in gravel mining in some of the

Middle Mining Counties,

Such as El Dorado, Placer, Nevada, Yuba, Sierra, Butte and Plumas, than those south and north. In Mariposa, Tuolumne, Calavarus and Amador, but little hydraulic miuing is being done. A few mines are being worked by the drifting process along the line of Table Mountain in the three last named counties. In those north of Plumas even lesa gravel mining is carried on, and yet there is no doubt of the existence of vast gravel beds in all of the counties named, both north and south. One reason for the slow progress made in deep gravel mining is the want of sufficient means by the mine owners to open their claims and to obtain the requisite water supply. On the

Declins of the Shallow Washings

The mining region was left in a state somewhat of chaos, as to the laws and regulations governing deep gravel mining. The laws were framed by Districts, and were peculiar to each, so as to accommodate ravine, bar or flat. These lawe granted but a small lot of ground to each man, which now is found too small for extended operations; and in order to obtain sufficient ground to justify the necessary outlay for opening bed rock tunnels, or cuts, for outlets, purchasing and laying down pipes, and constructing ditches for the supply of water, the owners are compelled either to consolidate their claims and work in common, or some one of their number more enterprising than the rest, or being possessed with more means, purchases the interests of his neighbors, thus securing a fine property to himself. But after becoming possessed of this large body of ground, though it might be ever so rich in gold duet, has an elephant on his hande. He has secured but one of the four essentials requieite for a highly remunerative mine—plenty of gold gravel. But water in greater quantity muet be had, with greater pressure, and still his property must remain worthlese to him without an outlet to drain the mine, and carry off the debrie and save the gold.

The Way Capital is Obtained.

What then is he to do? either to allow this valuable mine to remain idle or to obtain the means necessary to place it in working condition. To do this in San Francisco meane the eacrifice of a large portion of his property, or a rninoue rate of intereet to start with; and in the end the lose of his entire estate by the "freeze-out" principle, so prevalent here; he ie naturally frigbtened from seeking relief from thia quarter, and turns elsewhere. He is told there is an abundance of cheap money seeking investment, on the other side of the Atlantic. A party presente himself, representing so he says, men in Europe of unlimited means, who are desirous of investing in California mines. Thie individual pereuades the mine owner to give him a bond of his property for a year or so. Thie speculator or adventurer places it in the hands of a London promoter; it is hawked about for months, perhape; aud if it should finally succeed in finding a resting place, when it reachee the British public who eubscribe for the stock, it is watered to such a degree that it cannot possibly pay the promised dividends. The honest mine owner is willing, we will say, to take $50,000 for his property, and it would pay handeome returne on a reasonable advance above this eum, to cover commiesions for incorporating and raising the required capital to place it in working condition; but it will not pay on $500,000, at which it is capitalized. The result is, the owner of the mine is ruined, for he holde worthless shares. The subscriber is hugely disgusted, for he finds too late that he has been swindled, and can never agaiu be induced to invest in anything, however honest or legitimate, in the "blarsted" country. Somebody has made money on the other side, but our country and our people have to bear the stigma of cheats and swindlers when in truth they are innocent, for the fraud was perpetrated by London sharpers. All these things

Contribute to Retard Development

Of not only our gravel mines but other enterprises in thie country, and will continue to do so as loug as this state of things prevails. Is there no remedy? are those hidden millions of treasure to remain nncovered forever? We venture to say there is no region of the same extent on the globe that offers a better field for the investment of capital than the one here referred to; and yet it has been permitted, with a few isolated exceptions, to lie almost untouched. Gravel mining can be made just as certain of results, just as safe and just as legitimate as farming, merchandising or auy other branch of business, and far more profitable, for by the improvements recently introduced in this class of mining, thousands of tons of gravel can be removed with a single nozzle in 24 hours directed by one man. With

The Appliances now in Use

Hydraulic mining is by far the least expensive ever before used. With plenty of water properly applied gravel will pay largely, even when it contains but a few cents per cubic yard.

The Power of ths Pips

May be illustrated in many instances. At St. Louis, Sierra county, for example, Mr. W. R. Morgan, who ownes a valuable gravel property there, was recently running 3,000 inches of water through two 8-inch nozzles under a great pressure, and the effect on the high bank of gravel was truly wonderful. This tremendous force not only disintegrated the mass on which it was operating, but carried it off over the riffle blocks, etc., through the tail boxes depositing the gold dust in its course, and thus the work of a thoussnd men is performed by half a dozen assisted by this powerful and efficient agent, water. Mr. Morgan is thus enabled to clean up from $100,000 to $150,000 per annum at a very small expense, aud from ground, too, which would not pay anything under the old treatment.

Thousands of Claims of this Character

Are lying idle to-day, which could be utilized with an outlay of a few thousand dollars. Some very valuable mines are being worked in the locality of Gibsonville on the

Drifting Principle.

This is resorted to when the gold iu the gravel is concentrated in a strata on or near the bedrock, and is covered hy a mass of poor gravel, and will not pay for removal, even with the pipe, or, as in many cases, capped with volcanic ash or lava too hard to be removed by water. Mines of this class must necessarily possess rich deposits to ensure remunerative returns, for the work of mining and delivery to the dumps must be performed hy hand. The North America and Pilot, near Gibsonville, are of this class; and the former, owned by an English company, is said to be paying well. The Pilot joins the North America on the same lead, and is also payiug largely. The Caledonia, at St. Louis, is another mine of this class, which has paid handsomely for years. But, as a general thing, these driftiug-mines are not so numerous or productive as the hydraulic mines.

Water is the Great Want

Of the gravel region. Without it the miner can do nothiug. He may possess large and rich deposite of gold-gravel, but if he cannot get the water on it with sufficient preseure hie claim is valueless, and he must wait for eomething to turn up to give him the neceseary means to render it productive. That time must soon come, for the attention of capitalists, both of the Eastern States and Europe, ie being turned in this direction. Why cannot men of capital here see it in this light, take hold honeetly with the mine-owner, make fortunes for themselves, aud thereby

Develop the Resources of ths Country.

How much better would it be for all concerned if the millions of dollars now kept in a feverish state of excitement on the stock exchange could be applied in thie way. Soon we ehould see a different etate of things; inetead of the rise and fall of stocks depending wholly on "Rings" and "Corners," false reporte, etc., sharee would sell and be pnrchased on their merits, therehy producing a healthy state of finances as well as morals, the country developed, taxation lessened, and a new impetus given to immigration. We notice in certain localitiee symptoms of progress in this direction,

A Large Canal

Is now being constructed by local capital, to supply the wants of the extensiva mining localitiee of Iowa and Wisconsin Hills, Michigan Bluff, Forest Hill, etc., in Placer county. A project is in contemplation of a similar kind for the country arouud Placerville, El Dorado county. The Eureka Canal Company, whose ditches now supply a very rich and extensive section aloug its course from the head of Webber Creek, westward to Shingle Springe, embracing the well known mining Districts of Diamond Springs, Mud Springs, New Town, etc., all in El Dorado county, we are told are in negotiation with English capitalists for extensive improvements on their water system.

Our object in writing this ie to call the attention of our own people to the importance of this subject that they may be beforehand with outsiders on this important home question.

Our Natal Day.

Before this nnmber of the PRESS will have reached the homes of a majority of its patrons, that ever memorable day, the 4th of July, will have come again, and again passed away; but not to be forgotten, for so long as the American Continent shall stand up ont of the sea as solid land, so long will the day be remembered and celebrated by the people of the United States, as the birthday of freedom.

And it is becoming in ns as the descendants of noble and patriotic sires, in whose veins coursed the warm blood of a pure and holy heroism, that we should, as the inheritors of their great legacy, hold in remembrance and perpetuity, the sacred trust committed to us, by keeping alive in the hearts of our people, the causes and the conflict that resulted in the establishment of freedom's empire on American soil.

It is our only, truly national holiday, and as we have but one, every true lover of his country should in some way contribute, by devoting the day and his efforts to the keeping alive of that spirit of patriotism that can alone preserve our institutions, the honor and glory of our people among the nations.

If, then, it is the spirit of patriotism that we would kindle and nourish in the minds of our youth and keep the same alive as a perpetual fire, how can we do it better, than to let what there is of "old '76" spirit remaining amongst us, with all there is of "Young America," join in the grand, annual celebration so spiritedly predicted by the elder Adams; that the day would be celebrated by our children and our childrens' children, with processions and marchiugs and dinners and speeches and orations, the roar of cannon and the blaze of fireworks, bonfires and illuminations to the latest generations.

Now we drop right down from our "spread eagle" height to say, that to enable all, connected in any way with tha PRESS, including proprietors, editors, compositors and printers, to join in the celebration of the 4th, we issue the PRESS a day earlier than usual; so that if there should seem to be anything lacking in the present number, let it be charged to the account of "Independence day."

Disastrous Fire at Hamilton.

The mining towns of this coast are usually constructed in such a manner and with snch perishable materials, that when a fire is once started, it commits fearful ravages in a short time. A year seldom passes but that wa are called upon to chronicle the almost total destruction of mining towns or camps of more or less note. This time it is Hamilton, Nevada, at what is well kuown as White Pine. Tha loss in this instance amounts to about $600,000—a very disastrous one to so small a place. It is stated that the White Pine Water Company were culpably negligent in the performance of their contract with the city, as it was an hour after the fire started before any water could be procured, the engine honse itself being burned down. Water companies, howerever, whioh have a monopoly of the supply of any city or town, do about as they please in turning water off and on, so the complaint ie not an exceptional one. A case of the same kind occurred a few weeks since in San José, in thie State, and we were gratified to see that one of the partiee burned out, immediately sued the water company for not furnishing the water, and the case is now pending. Similar complaints hava been made against the water company now supplying the city of Oakland. For some reason the supply is turned off periodically, and at such timee when fires occur disastrone results are sure to follow. If people pay for water and pay taxes, it should be furnished at all times when in the power of the company.

There is said to be conaiderable suffering among the poor familiee turned out of their homes hy the Hamilton fire, hut the people are helping one another as much as poseible. A diepatch from Hamilton statee that there is no doubt that the fire was the work of an incendiary. Below is a list of lossee as far as known at present:

P. A. Wagner.....	$45,000	F. W. Cole.....	$ 2,500
(No insurance.)		Marshall Atwood....	5,000
Perry's Saloon.....	9,000	Wm. Hendrie.....	2,000
H. Light.....	5,000	Woodruff & Ennor...	30,000
Smith Bros.....	5,000	Jack Wadish.....	1,500
Chas. Friedman	1,500	City of Hamilton....	20,000
P. Rowell.....	1,500	A. Haas.....	15,000
Fred. Vettulan.....	800	Marco Medin.....	28,000
A. Jackson.....	32,000	Wm. Plumhof.....	2,500
A. Man & Co.....	45,000	G. Hudson.....	2,000
(Insured $12,000.)		H. Crowell.....	8,000
L. C. Scott.....	3,000	M. Cohn & Bro.....	3,000
Wm. Davidson.....	4,000	F. Pramenko.....	9,000
J. R. Withington....	3,000	J. Cohn & Bro.....	33,000
R. Hyman.....	2,000	(Insured $18,000.)	
F. W. Clute.....	30,000	Dennis Dailey.....	2,500
W. H. Naylor.....	3,500	Ada Mordaunt.....	7,500
Louis Scadow.....	2,500		

Other loeses, not apportioned, will probably bring the total np to nearly six hnndred thousand dollars.

Accidents in Mines.

Scarcely a week passes bot what we are called upon to record nnmerons accidents resnlting in loss of life or injury, incurred in pursning mining operations. Many of these are the resnlt of accidents whlch conld scarcely have been foreseen, bnt by far the greater majority are caused from carelessness or bad management. Miners are, from tha very nature of tbeir occnpation, more exposed to danger of life and limb, than perhaps any other class of people, sailors not excepted. Prematnre explosions, defectivo blasts, breakage of machinery, caves, fire, etc., combine to make their lives dangerons. Moreover when men get nsed to handling powder, to running up and down shafts in cages or tubs seversl times a day, working in dangerons gronnd, etc., they natnrally become careless and negligent to a greator or less degree, and the fact that they havo done these things so often without accident, begeta a confidence that there is no danger in them. Occasionally, when a man is hurt or killed, the others abont the mine will be unnsually careful and attentive for a wbile, until the impression wears off, when the old state of things is again in order. Of conrse, if men will not take ordinary precantions to preserve thoir lives, others have to legislate for them, jost as our law makers pass wise laws to protect "poor Jack" from those rapscions land sharks—sailor "boarding masters." The only tronble with such laws as these is, that they seldom have the effect required; for if a sailor wants to throw his money away he is honnd to do it, the laws notwithstanding; and if a miner ohoses to risk his precions neck from day to day in dangerons ground or on defective hoisting gear, or with bad powder, he will probably do so. Bnt by "going after" the proprietors, a partial solution to the problem may be hsd. Still, some one mnst complain of defective arrangements, a thing tbat miners seldom do unless for a grudge. Aa long as they work in the mine where snch things exist they take them as they come, without mnch comment.

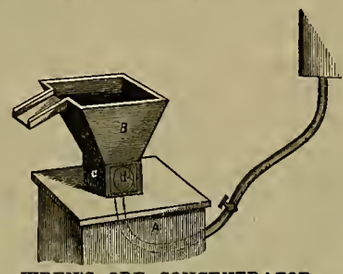
There are laws now in existence, which, to a certain extent, provide for the protection of miners as regards ontlet from a mine in case of fire and in other particnlars. They are, however, a dead letter in most cases, for we have yet to hear of one where infraction of the rules has been pnnished. In a good many mines on this coast, rickety old hoisting gear is used for hoisting men, which is dangerons in the extreme; bnt the owners argue that if anything breaks, it will be with a heavy load of ore, not men. We are glad to say however, that good, secure machinery is the rule on this coast and bad mschinery the exception. In speaking of the pnnishment of mine owners for keeping damaged or insnfficient gear, etc., an illnstration of the method they are dealt with nnder the new English Mining Law comes to ns in one of our late foreign exchanges.

A boy was killed by falling down a shaft in a colliery. At the inqnest it was shown that the machinery was of the most antiqnated description. A gin was erected at tbe top of the shaft, to which was attached a couple of ropes, and cars; as the one descended the other ascended, communication being made to tbe man on the dnmp, to set the machinery in motion, when reqnired. The man was frequently absent, and a neighboring qnarryman discharged his fnnctions, while at other times they were done by passers-by. One day the boy gave the signal to come up, which was answered by some one nnknown, and he hitched himself in tbe chains and ascended. The weight of the descending car proved too heavy a balance, he went np with a surge, and on coming in contact with the gin, was precipitated down the shaft and killed. The jury retnrned a verdict of manslaugbter against the proprietor. This is an exceptional case, hut one warranted to impress mine owners with a healthy regard for tbe lives of their employés. The English mining laws recently passed are mnch more stringent, with regard to these particulars, than are ours. One provision creates a system for securing the competency of managers; another lays down certain general rules for the prevention of accidents; a third provides that an amount of ventilation shall be prodnced in every mine, sufficient to dilnte the noxions gases; a fourth establishes a board of inspectors, to see that the various provisions are carried ont. It is also provided that the mines shall be inspected at least once in 24 hours, and a regular report made.

The Concentration of Ores.

On this coast where low-grade ores are abnndant, and where metallurgical establishments are few and far between, onr low-grade mines are worked bnt little. Only mines that carry ore of a high grade are worked, with bnt few exceptions. Experience has proven, however, in older mining countries, that mines with large quantities of low-grade ore pay better in the long run thau those with "bunches" of rich ore. Those mines in Enropo wbich pay the largest dividends, derive thoir profit from tho masses of their low-grade ore. Tbese facts are well known and fully recognized by every one who has had any experience on the snbject. It is necessary, therefore, in view of these facts and the high price of freight on teams and railroads on the Pacific Coast, tbat before these masses of low-grade ore can be shipped, tbey must be concentrated at the mine where tbey are produced. Thonsands of mines now lying idle conld be worked to profit if an effioient concentrator was nsed to free the ore of the lighter gangue, which is so mnch nseless and more than nseless dead weight in shipping. Some of the Colorado mines were of no value nntil this system was adopted, and it will no donbt be more generally introduced here when better nnderstood.

Low-grade ores which are now left on the dumps of many mines as nseless, and are only hoisted to get ont of the way, could be made a source of wealth to the owners if properly concentrated. Ore that is concentrated will bring donble its nsnal valne, in conseqnence of the increase of percentage of the metals, and the earthy matter having been got rid of the smelter can afford to pay higber prices still, since it reqnires comparatively no fluxes. Onr friend Mr. Henry Sewell, of Salt Lake, has recently written a letter to the *Tribune* wherein he takes the ground that it is cheaper for the miners there to concentrate their ores and sell



WREN'S ORE CONCENTRATOR.

them to smelters than to smelt them themselves. In support of his position he says:

In most conntries where extensive mining has hronght ahont competition among smelters of ores, the owners of mines have fonnd it more advantageous to sell their ore than attempt to smelt it themselves, becanse they cannot compete with the former. The canse of this is evident—the smelters work on a large scale, and his onrrent expenses are subdivided among his many furnaces, and conseqnently he can work at much less cost than the miner; besides this the smelter collects ores for his furnaces from many districts, and by so doing provides himself with ores that flux each other, whilst the miner as a general rule is forced to purchase fluxes, as he can rarely connt npon any other ores than those supplied by his own mine. The miner almost always is compelled to place his furnace contiguona to his mine, whereas the smelter locates his furnaces at some central point where he can connt upon quantity ss well as qnality.

This is the true source of competition between the miner and the smelter, and it is therefore manifest that ere long the miners of Utab will abandon the idea of smelting their own ores.

We have not the space to go into details of this subject as we wonld like to, but are assured that there is little doubt, hut that in the near futnre thousands of tons of now worthless ore will be concentrated into one-half or one-qnarter their bulk, hy some cheap process, and then be made marketable and profitable. Water is the best agent for accomplishing this object, the manner of application is the only question to he solved. A move in this direction has been made by Thomas Wren, of Hamilton, Nevada, who has recently patented a concentrator of unique design, and which thongh simple in construction seems efficient and reliable. A cut showing the method employed is herewith shown.

The concentrator is designed to concentrate snlphurets as well as ores. A closed tank, *A*, of any desired form, is constructed, having a hopper, *B*, snpported above it by a short box, *C*, the lower end of wbich communicates with the tank, at or near the centre of its top. A small pane of glass, *b*, is secured in two opposite sides of the box, c, so as to serve as windows throngh which the operation can be examined from tho ontside for the pnrpose of regulating the flow of water. A water tank is placed at a snfficient height above the tank to give the reqnired bydrostatic presnre. A pipe leads from the water tank to tbe tank, *A*, and a cock serves to regulate the flow of water through the pipe.

The powers of concentration are simply as follows: the cork is opened so as to allow the water from the npper tank to flow through it and fill tbe tank *A*, the box, *C*, and tbe hopper, *B*, and flow off tbrough the spont or sluice shown at one side of the hopper. The pulverized ore or pnlp is tben emptied into the hopper, when the eartby and light particles will be carried away through the spout, while the heavier particles snch as solphurets, heavy particles of ore, metals, etc., will sink to the bottom of the tank, from which they can be removed when desired. By examining the state of the operation through tbe windows, the exact amonnt of pressnre required to properly accomplish the separation of the gangue or tailings from the heavier particles, can readily be arrived at, and the proper pressure regnlated by means of the cock. By this means the light and worthless portions of the pnlp can be separated from the valuable parts, with bnt little tronble, and by a *continuous operation*; of conrse an apparatns of this kind could be run for little expense, as only one man wonld be required to take care of it. The force of water can be regnlated for different classes of ore, and can be adjusted to a nicety by examining the process throngh the little panes of glass provided for tbe purpose.

As the mining of ores and their reduction forms one of the most important branches of indostry to the Pacific States and Territories, and as the majority of ores in every country are low grade, concentration mnst be resorted to here by some method or other, in order to make it profitable to work and ship them. Until some cheap and covenient method is applied, thonsands of tons of profitable ores must be idle, and retain their wealth.

The Virginia Calamity.

A fearful calamity occurred at Virginia, Nevada, on the night of the 30th nlt., by whicb many lives were lost and mnch valuable property was destroyed. A fire which ensued completed tbe work of destruction. The following bnildings were shattered and partily thrown to the ground: Bank of California, and bnildings to the rear of it, Kennedy and Mallon's grocery store, Donglass' building, nsed in the upper apartment as a lodging house, Daley's saloon, and Armory Hall. The cause of the accident was donbtless nitro-glycerine. General Van Bokkelen, who was killed, was local agent of several powder companies, and is said to have had in the building six csns of nitro-glycerine, a quantity of Giant Powder, Hercnles Powdor and also some common powder. The nitro-glycerine isthougbt to have exploded first and the concnssion exploded the Giant Powder. We have no definite statements as yet in relation to the matter, but there is little donbt bnt that it was the nitro-glycerine that caused the explosion. We shall probably be ahle to give fnrther particulars with regard to its origin in our next issne.

The result would, doubtless, have been mnch more disastrons had the explosion occnrred in the day time instead of at night, as the locality was in the center [of the business portion of the city. It seems strange that a lot of explosive materials of the kind mentioned, should be kept stowed in a lodging house in a popnlous town like Virginia. The losses by tbe fire and explosion are put at abont $225,000. The killed, as far as known, were Major General J. L. Van Bokkelen, J. P. Smith, William Davis, B. Mandel, Mrs. Ed. Dean and ber little daughter, William Low, Charles Knox, Mrs. Emily O'Connor and John Devine. The wounded were numerous, among them are William Spear, Daniel Ingalls, H. Hildebrand, George Hill and Mrs. L. A. Taylor. A nnmber of firemen were slightly injured by falls, falling timbers, parial asphyxiation, etc.

Mr. Chas. H. Knox was connected with the Golden State Iron Works of this city. He leaves a wife, son and three brothers, and botb parents living. He was much respected.

Mr. Knox conversed in a very calm manner for some time after the flames had taken hold of his lower limbs, and were consnming him hy inches. He was caught among the fallen walls and timbers and after heseeching his friends to cut him out, and finding it was impossible for them to do so, he said: "Never mind hoys, save the others; Billy Lowe is dead and Charley is gone also!" and died without a murmur.

We notice, with pleasure, that the money donated for the celebration of the 4th of July, in both Virginia City and Hamilton, has been set aside for the benefit of snfferers in the disasters at the respective towns.

Patents & Inventions.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

From Official Reports for the Mining and Scientific Press, DEWEY & CO., Publishers and U. S. and Foreign Patent Agents]

By Spacial Dispatch, Dated Waahington, D. C., July 1st, 1873.

For Week Ending June 17th, 1873.*

Steam Plow.—Peter J. McDonald, S. F., Cal.

Harrow.—Parmenas N. Woodworth, Stony Point, Cal.

Brake Reaction-Movement.—Horace B. Martin, S. F., Cal.

Coal Screen and Chote.—Martin R. Roberts, S. F., Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventers transacted with greater security and in much less time than by any other agency.

Bottle and Can Clamp.—Mr. James N. Carter, of Virgina City, Nevada, has invented a simple, cheap and convenient clamping device, for securing cans, bottles and other containing vessels upon a platform, counter or shelf so that they cannot be shaken down or removed without unlocking or releasing the clamp. The device is chiefly intended for securing milk cans to the bottom or floor of milk wagons, thus obviating the necessity of converting the wagon bed into a series of compartments as nsually practiced. In this country of earthquakes, the device will be excellent for preventing glassware and bottles from being shaken down and broken when the "shake" comes. Mr. Carter, has secured protection for his invention through the Scientific Press Patent Agency.

The New Idria Case.—Here is the latest action in the case of the New Idria Quicksilver Co., as telegraphed to the city dailies: About two years ago the Secretary of the Interior denied the application of the New Idria Quicksilver Mining Company for a patent for mining land in California, which is also claimed by McGarrahan. The New Idria claimants snbseqnently filed an application for a rehearing, and no action being taken on it they recently reqnested the Secretary of the Interior to refer tbe whole matter to the Attorney-General for final adjudication. This request was refused by Secretary Delano, whereupon the New Idria claimants appealed to President Grant to order such reference. The President declined to interfere, and the company's application for a rehearing and their amended petition for a patent are still pending before the Secretary of the Interior.

New Dam.—The Nevada *Transcript* learns that the South Yuba Canal Compsny contemplate the early construction of a dam at the lower end of Fordyce, near the site of Meadow Lake. The construction of this dam will give an abundant supply of water, greatly enhance the value of the property, and he of great benefit to all mining claims in the territory supplied by the canals and ditches of the South Yuba Company.

Nickel.—Everybody wants to find nickel, for a mine of it would be immensely valuable. Several of the interior papers speak of the probability of finding it in their vicinity. News now comes from British Columbia to the effect that a rich deposit of this mineral has been discovered near Cowichan. If this is so it will not he long before the discoverer finds a purchaser for his mine or his ore.

Eureka Mine.—A dispatch from Washington states that E. C. Ingersoll has made an argument before Solicitor Smith, Acting Secretary of the Interior, in behalf of the Eureka Mining Company, of California, relative to the time within which adverse claims must be filed, claiming that the first day of publication should be counted as one of the sixty days mentioned in the statute.

More Coal has been found in Contra Costa county, at Pine Cañon, San Miguel Ranch, near Davisville. The vein a few feet from the surface is about 10 inches wide. Several coal mines have also been found in Santa Cruz county, at Loami Prieta Mountain, near the headwaters of Corallitas creek. The coal is said to be of good quality.

The Owyhee *Avalanche* thinks the bullion shipments from that region this month will reach $100,000.

Daniel Wellington, of Virginia City, Nevada, is requested to communicate immediately with this office.

Consumption of Sugar.

During ths past year 83,000,000 pounds of sugar was imported to the Pacific coast. Of this 65,500,000 pounds was oonsumed. Thsre was only 1,500,000 pounds of heet sngar manfactured in the State, hy ths factories of Sacramento and Alvarado, so thers is still room for eighty-six such factoriss, giving employmsnt to 8,600 operatives for sevsn months of ths year—from August until March—not to speak of ths Chinsse, nnmbering ons hundred, on the Alvarado Company's farm, whsre they ars employed in weeding, hoeing, stc. These Chiness ars the only hands at present employed on the Alvarado farm, and are kspt to cultivate ths young heets.

The Future Prospects of Beet Culture.

Although various opinions ars sntsrtained as to whsthsr or not the growth of hsets is hsneficial to the soil, ths prevailing idea is that it is attendsd with good resnlts. Many of the farmers in the nsighhorhood of the mill who raised heets for two consecutive years and sowed whsat on the third, found the crops hettsr than usual. The hosing necessary to the growth of hests effectnally clears the ground of the lnxnriant wseds so detrimental to yonng grain. Every farmsr is aware of the fact that the soil rsquires a change in the kind of produce it raisee. Snccessive crope of one particnlar variety only impoverish the soil.

Should the manufactnre of heet-sugar hecome exteneive, the demand for heets will probahly influence farmere (as in the case of those ln Alvarado) to resort to their culture as a change of crop. The venture of the Alvarado Company has proved eminently successfnl, and the farmers of the locality have discovered that it ie poseihle to raise a very fair crop of heets when wheat from excessive moietnre or drought has entirely failed. The prospects of heet culture in this State are exceedingly promising, and with the decline of cane-eugar manufacture in the arid fields of the Sonthern States, it is not improhable that it will ultimately he the eource of snpply of a large portion of the sugar consumed in the United Statee.—*Bulletin.*

Farmers' Anti-Monopoly Movement.

An Illinois paper, commenting upon the election of Craig, the farmers' candidate for Jndge of the Snpreme Court, saye that that election is only an incident in the movement. It is not the end aimed at, nor the heginning of the end. It serves only to draw the dividing linee distinguishing those who are heartily in sympathy with the anti-monopoly movement, from those who tremhlingly gave it a quasi endorsement, not dariug to take a positive stand on either side. The farmere have no idea of stopping their action with thie election; indeed, no one thought of thie election when they hegan operations; hut they will go on until thsy elect a Legislature, Governor, membere of Congrees, and a President, if need he, if their objects are not attained otherwise. They are fully aware that it wonld he convenient, in a great movement of this kind, to have "friende at court;" to have men in public positione who are in aympathy with them, and will render them assistance iu organizing and keeping together. Hence they will endeavor to see that the various county offices, to he filled next fall, are eupplied with men who have already proved to he with them in sentiment and sympathy.

Hoisting Machinery in Salt Lake. — The *Alta* correspondent at Salt Lake says: It is the liveliest camp he has struck yet. Everywhere he meete strangers from the East and not a few notahle epecnlatore from the Bay, hargaining for mines. The great want is mills and furnaces. Mr. Howland, late of the Miners' Foundry, has aasociated with Eaetern capitalists, to pnt np a custom mill of 20 etampe at Palace Park, 28 miles from Salt Lake. It is well understood that San Francisco is the safeet place to get reliahle milling worke. The contract has heen awarded to Messrs. Bordwell & Malter, constrncting engineers. It is to he in all respects a first-class eilver mill.

Gold Diggings are heing worked hy Russians and Norwegians in Lapland, hut strange to say, no "Old California minere" have as yet passed their opinions on the diggins, there heing no Americans there. The ubiquity of "old 49ere" is eo proverhial that it is strange none of them have visited Lapland yet.

The shaft in the Gwin mine, Calaveras County, is now down 700 feet, the contract for sinking 100 feet helow the 600 feet level having heen finished. The last hundred feet finished is spoken of as a masterpiece of workmanehip. The mine is yielding well.

Michigan Capitalists have invested over $600,000 in Utah mines and will shortly erect five smelting furnaces on a 40-acre tract near Salt Lake City.

The Wheat Crop.

A special Washington dispatch to the Chicago *Tribune*, under dats of Jnne 13th says: Accounts are now in from snongh of the wheat-growing States to show that the crop of thie year will, in all prohahility, he less than half what it was last year. In Wsstsrn New York, and in fact along the lake region of the conntry, the winter wheat is, as might have heen expected from the unusual severity of the past season, atmost a total failnre. Other crops havs also hesn sevsrely injured hy ths late spring. The long-continued wst weather prevails in Iowa, and ths crops are suffering greatly.

There is evsry reason to helieve that, with the sxception of ths fruit crops, all others will be very short, ths dsficiency heing especially heavy in cereals. In fact, 1873 will probahly hs the worst year ws have had since ths beginning of the war. Ths wheat crop is alrsady heing harvested in the Southern States, and as far north as the Shsnandoah Valley. In soms cassa it has been vsry fair, hut hy the time the great hslt of the Central States is reached it is hslieved that ths falling off of the crop will he such as will astonish ths conntry, and affect the financial situation.

Scarcity of Water is felt at the mills on the Seven-mile and other cañons near Virginia City, and surplns ore is accumnlating. On the completion of the water works now heing constructed hy the Virginia and Gold Hill Water Co., this want will uot he felt.

Late experiments render it prohahle that the cost of manufactnring magneeium, so much in nse for photographic and illuminating purpoees, will ehortly he reduced to such a degree that it can prohahly he sold for three or fonr dollars per pound.

Estimated Yield.—A number of gentlemen connected with the mining interests, estimate that the daily ore supply of the mines ahont Salt Lake City, will he after July 1st, 700 tons, of which Little Cottonwood will yield 200 tons.

Copper Reduction works are to he erected at Golden, Colorado, hy a company, who were induced to do so by the existence of copper ores in Jefferson County in quantities sufficiently large to pay for working.

Over 65,000 hars of Cerro Gordo hullion paseed over the Los Angelee and Wilmington railroad last year, and the Los Angeles *Star* eays there will he a material raise in the figure thie ensuing year.

Pumping ann Hoisting machinery hae heen hought for the Santa Rosa Coal mine, Sonoma county. The mine is eaid to he producing an excellent quality of coal.

A Bar has heen fonnd in a cañon near San Rafael, Lower California, which ie rich in placer gold. No work can he done on it until the rainy season sets in.

Work has heen commenced on a new ledge, recently discovered ahout 8 miles helow Burnside, San Bernardino county. The ledge ie 4 feet wide and shows free gold.

The coal area of China is eetimated at 97,000 sqnare miles, and the area of coal lands in the United States ia said to he 120,000 square miles.

Coal of good qnality hae heen diecoverod at Pancake ahout 15 milee from Hamilton, White Pine, Nevada. It is important to the emelters at Eureka.

An Extension of the Golden Chariot, the crack mine of San Diego conuty, has heen etruck, the croppings of which are large and rich.

The Idaho mine in Nevada county last week cleaned up $26,000 from six days' work, with 35 stamps.

The Bullion ahipment from Eureka, Nev., on the 19th, was 50,000 pounds—two and a half car loads.

The Gold Hill tailings mill has completed ite first run and clean-up, $596, in four days' run.

The Salt Lake Stock Board which was to have heen opened in June, hae not ae yet heen heard from.

The furnaces ahout Eureka, Nevada, use 8,400 hushels of coal per day.

The New Quartz mill on the Vulture mine, Oregon, is doing well.

Working Low Grade Ores.

This question, says ths Salt Lake *Tribune*, is ons of vital interest as touching the fnture wslfare of the Territory, and demands all ths attention which can he hestowed upon it hy those interested in the dsvelopment of our mineral rssources. It is thsrefore necessary ths ingenuity of man he exercised in searching out some economical plan hy which the great hulk can he utilized. The expsriencs of msn well versed in mining matters is that nine-tenths of ths ores in Utah are not of more than the average value of $40 per ton.

In our opinion, the first step to hs taken towards hringing ahout the desideratum in question is to separate ths gangue from the purs ore, and thereby secure the greatest value in the smallest compass; and the second step is to discover some dsscription of furnacs which shall bs simple in constrnction, efficient in its opsration, insxpensive to huild, and that will smelt the concsntrated ore at a heat that will not incur a loss hy volatilization.

The present msthods of smelting low grade ores, espscially those that are very rehsllious require so much hsat and consequsnt large consumption of fuel, causing thershy so much loss in hoth lead and silver, through oxidation and volatilization, that no profits can he realized, but, on the contrary, losses are sustainsd.

Experiments in separation and concentration wsre made in the month of March of the prssent year on oree from the De Soto mine, Humholdt county, Nevada. The ore contained from three to five per cent. of hase metal, principally antimony, also eome lead and zinc; the silver moetly occurred as a hlack sulphuret. The assay value in silver was ahout $54 to the ton.

The following resnlts of the treatment of the ore by three different methods are of interest to the mining and scientific world:

First. By amalgamation (stamp-mill) process, the loss was to suoh an extent ae not to allow any margin at all for the expense of working.

Second. By the most approved method of wet concentration eeventy-five per cent. of the silver was lost and the twenty-five per cent. saved for final treatment wae not eufficient to pay expenses.

Third. By Krom's dry crushing and dry concentrating process over ninety five per cent. of silver was eaved, and the result produced was over $1,000 in eilver to the ton of concentrated ore from the original, which contained in hulk only $54 of silver to the ton.

The expense of the Krom syetem is said to he less than any other mode in nse.

So much for the first step in onr theory. We next come to the question of improved frnaces.

There are two new processee which are iuvitiug puhlic atteotiou.

One is the "Stevens Oxy-hydrogen Furnace," the inventor of which claims that at a very trifling expense in fuel a very intense heat can he ohtained. Any description of fnel may he usod, petroleum, coal tar, coal or wood hnrn eqnally well. A large furnace on this plan hae heen erected at Eureka, Nevada, and the owner of it claime that he can smelt ore at $15 per ton, a redoction of ahout fifty per cent. on former ratee. Another of less size has also heen hnilt at Sandy Station of the U. S. Railroad, hut neither of them yet have demonetrated that what is claimed for them can he performed.

Another process is that of emelting in vacuum. By this plan it is argued that volatilization and oxydation are avoided. A very great eaving in fuel is effected, and much hetter resulte can he ohtained hy the process than hy a hlast or draft of air.

We have taken great pains to inquire into the merits of the varions improvements now heing introdnced, and shall throngh onr columns continue to inform our readers of what is paesing in the development of plans that have for their end the hringing ahont of that important desideratum the utilization of onr low grade ores.

Assyrian Research.—The following telegram has heen received hy the proprietors of the *Daily Telegraph*, from Mr. George Smith: I am excavating the site of the King's Library, at Nineveh, which I fonnd without much difficulty. Many freeh objects of high importance have rewarded my eearch. Since my last meseage, I have come npon numerous valnahle inscriptione and fragments of all claeses, including very curions syllaharies and hilingual records. Among them ie a remarkahle tahle of the penalties for neglect or infraction of the laws. But my most fortunate discovery is that of a hroken tahlet, containing the very portion of the text which was missing from the Deluge tahlet. Immense maeses of earth and debris overlie whatever remains to he brought to light in this part of the great monnd. Much time and large sums of money would he required to lay it open. I therefore wait instructione from you and the Musenm, as the eeaeon is closing.

Madder.—The *Alta* says, John L. Beard, Esq., haegrowing on his farm at Centerville, across the hay, ahout one acre of *madder*, the root of which is nsed for dyeing purposes. The seed wae brought hy Mr. Beard from Holland to he need as an experiment, which so far appears moet succesaful. We are informed that no other attempt has heen made to cultivate the plant in this State.

Something about the Carson River.—From Mr. S. E. Jones of Empire we gathsr the materials for the following facts and figures: The amount of wood now coming out of the ditch, going over the dam and coming down the rivsr may bs put down in round nnmhers at say 65,000 cords Of this amount, 15,000 cords go over ths dam and down to Dayton; the halance remaining in Empire. This fifty thousand cords are ownsd by various parties, Messrs. Smith & Jones heing the largest ownsrs. This drive is hronght down under contract hy Messrs Bryant & Flanders, and is coming on prosperously. Hitherto ten hours has heen a day's work hy the men employed in taking the wood out of the ditch ; hut from this on until the wood is all on the hank sixteen honrs will he a days's work—that is, from 4 in the morning till 8 in the eveuing. It is hardly correct, though, to call this a day's work, for it conveys a wrong impression; ws should say, mors propsrly, that ths sbifts will he off and on during the hours indicated. The water is falling very rapidly under the influence of this wram weather—falling more than an inch a day. This, it is thought, will soon reduce the power and hullion producing capacity of ths larger Carson river mills—the Mexican, Brunswick and Eureka, thongh it prohahly won't maks much differenes with the smaller ones. Present appearances indicate that ths river will he lower this year than for some seasons past. The wood drivers will he lucky if they gst ths ir contracts completed without any serious mishaps.—*Carson Appeal.*

The "Garibaldi" Leuge.—A corresponden writes us ae follows concerning thie mine: It ie situated near Rohinson's Ferry, Calaveras county, California, ie turning out a large quantity of high grade ore. It ie worked throngh a tnnnel, 152 feet long, cutting two hodiee of ore aggregatiug 13 feet in width, parted hy a eix inch clay seam, the head wall having a gonge of twelve inches, eoft and wet. Average ore from the eaet vein pulps over thirty dollare per ton, free gold. From appearances there ie eufficient ore ahove the line of the tunnel to rnn a forty-stamp mill five yeare. Water power is abundant and cheap, the Stanislaus river croesing the vein at each end of the claim. Messrs. Rogers and Lewie, who are opening the mine, have 160 acree of timher land and a heautiful mill site adjoining their property. The knowing ones in that vicinity are highly pleased with the quantity and grade of ore in eight.

A New Chlorinizing and Desulphurizing Furnace.—A new chlorinizing and desulphurizing fnrnace has recently heen invented hy one Thomas McGlew, of Austin, Nevada, which promiees to eclipee the Stetefeldt and all other fnrnaces for the roasting of oree. The Virginia *Chronicle* speake of it as follows: The entire cost of putting one in running order will not exceed $2,000. It can he run twenty-four honrs hy three men, one on each shift of eight hours each. The heat can he regnlated to suit all kinde of ores, and this ie the only kind of furuace in which the heat can he increaeed or diminished ae reqnired. The coet of roasting orcs hy this furnace will not exceed $4 per ton, and it ie guaranteed to chlorinize all ore as high as 95 per cent. of the assay value. Should the furnace he adopted here, a saving of millions of dollars will ho made annually, as now only from 60 to 65 per cent is saved.

A Cheap Paint.—The *American Agriculturist* of a recent date, says:—Ahout seven yeare ago, a Mr. Wheeler, of thie place, hnilt a hridge for the town, which he painted with the following composition:—Water lime (hydraulic lime) mixed with skimmed milk to the consistance of common paint. It was pnt on with a short handled whitewash hrush; eight or ten quarts were applied. It can he shaded hy addition of varione coloring mattere to suit the taste or fancy. The hridge was painted eeven years ago. I pass it almost weekly, and I snpposed it was covered with lead paint till told to the contrary. This paint ie adapted to coarse, rongh out-door work, and out-buildings which are covered with unplained hoarde. There are a numher of harns in this vioinity painted with thie mixtnre; they have a rather neat appearance in contrast with those not painted. The cost ie hut little; the lime can he procured for $6 to $9 per harrel. Those who have nsed it, epeak well of it. Any one can put it ou with a whitewash hrush.

SAN FRANCISCO
Journal of Commerce
—AND—
MERCANTILE DIRECTOR.

We desire to draw public attention to ths fact that the "Pacific Coast Mercantile Director" is now known as the **San Francisco Journal of Commerce and Mercantile Director."**

It is a new 8-page monthly nswspaper, of special information for wholesale and retail tradesmen. It also contains reading matter of interest and importance to all businsss and professional msn on the coast.

OUR TABLE OF CONTENTS

Compriss Full Prices Currsnt and Monthly Revisw of ths Wholesals Markets; Diagrams of ths Fluctnations of ths Wheat Markets; Rates of Ocsan Freight—corrsctsd monthly; Illnstrations and Sketchss of Prominsnt Men and Buildings; Editorials on Manufscturing and Industrial Progress; Dspartmsnts containing appropriate rsading matter and rsviews for varions branchss of trade, lnoluding "Grocsry and Provision;" "Dry Goods;" "Drngs;" "Building;" "Trades and Manufactures," etc., stc.

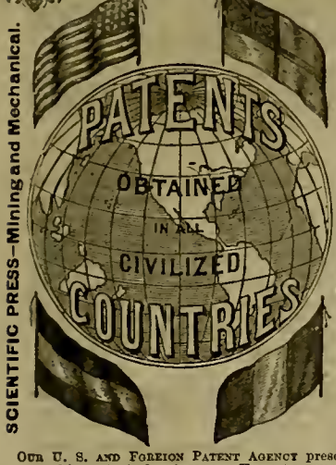
Our first issnss consist of 8 pages, smbraoing FORTY-EIGHT Columns of important reading matter for Tradssmen—mostly original and by first-class writers. Sample copies, post paid, 10 cts. Yearly snbscription, in advance, $1.50. Snbscribers to ths Mining and Scientific Press or the Pacific Rural Press will be snpplisd at half price.

Published by **MURRAY, DEWEY & CO.,**
At the Publishing Office of the Mining and Scientific Press and Pacific Rural Press, San Francisco.

DEWEY & CO'S

SCIENTIFIC PRESS

Patent Agency.



SCIENTIFIC PRESS—Mining and Mechanical. PACIFIC RURAL PRESS—Agricultural.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the Mining and Scientific Press. We transact every branch of Patent business, and obtain Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. Advice and Circulars free.

DEWEY & CO.,

Publishers, Patent Agents, and Engravers,

No. 338 Montgomery st., San Francisco, Cal.

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and Retail, by DEWEY CO., Mining and Scientific Press Office, S. F.

BY GUIDO KUSTEL,

Mining Engineer and Metallurgist.

Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his speciality.

Price $2.50 coin, or $3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1807.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams illustrating machinery, etc., which alone are of the greatest value. PRICE REDUCED TO $5.

Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of California and Nevada, with full explanations and directions for all metallurgica operations connected with silver and gold from a preliminary examination of the ore to the final cas tin of the ingot. Also, a description of the general metallurgy of silver ores. 1864.

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of exceeding value to both the moderately informed and the most expert operator.

Price, $6 in cloth; $5 in leather—coin.

BY OTHER AUTHORS.

The Quartz Operator's Hand-Book; by P. M. Randall. 1871. Revised and Enlarged Edition. Cloth bound, 175 pages. Price, $2.

Sulphurets: What They Are, How Concentrated, How Assayed, and How Worked: with a Chapter on the Blow-Pipe Assay of Minerals. By Wm. M. Barstow, M.D.; 1867; cloth bound, 114 pages. Printed and sold by Dewey & Co. Price, $1; postage free. The best written work, and most complete work on the subject treated.

ANY OTHER BOOKS DESIRED will be furnished at the most reasonable rates by Dewey & Co., Mining and Scientific Press Office, S. F.

Every Mechanic should read and familiarize himself with "Brown's 507 Mechanical Movements," illustrated, published and sold by Dewey & Co., Mining and Scientific Press office, S. F. Bound in cloth. Price, (very low) post paid, $1, coin, or its equivalent in currency. Inventors, Engineers, Students, and Apprentices will find it exceedingly useful and especially handy for reference,

Valuable Premiums for Subscriptions.

A Sewing Machine of Real Value (Beckwith's) given for $40 worth of Subscriptions.

The American Agriculturist, in speaking of this Machine, says:

We are prepared to indorse the Beckwith Sewing Machine as one worthy of being at once secured by all who cannot purchase the expensive machines.

1st. It is well and strongly made.

2d. It is easily attached to any table or stand having a leaf or edge projecting an inch or so, and can thus be used in any part of the house, near a window, etc.

3d. It makes the elastic loop stitch (the same as the Wilcox & Gibbs and some other good machines), which with a little care in making the closing stitch is abundantly strong for nearly all kinds of sewing, and less liable to break in washing and wearing, owing to its elasticity.

WE WILL GIVE

For $14, a Machine and the Illustrated Press, 1 year.

For $12, a Machine and the Mining & Scientific Press, 6 mos.

For 12, a Machine and the Pacific Rural Press, 8 mos.

For $13.50, a Machine and the Mining & Scientific Press, 1 yr.

For $13.50, a Machine and the Pacific Rural Press, 1 year.

For $40, we will give a Machine and $40 worth of subscriptions to either paper or all jointly at regular rates. Send for Circular.

Express charges must be paid by the purchaser. Address, for further particulars, the PUBLISHERS OF THIS JOURNAL.

A CARD.

The subscriber offers his services to the public for the examination of mines and mining properties. This State abounds in quartz mining properties, which are present failures from the want of knowledge in their development or management. Witness Nevada, El Dorado, Tuolumne and Mariposa counties; witness also Amador county with its Potosi, Scaton, Hazard, Plymouth, El Dorado, Original Amador, Herbert ville, Union, Mahoney, Summit and other gold mining properties, all of which are intrinsically first-class mines, yet all of the above and others in that county are present failures.

But their successful development depends upon Geology, Orology, Topography, a knowledge of "the Chemistry of Rocks and their relations to mines and mining," an apprehension of Nature's great plan of their development: in short, the mathematics of mining.

In the above respect, the subscriber believes himself thoroughly master of the situation. Consultation free.

BROWN'S PATENT LAMP.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 150 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.

Mr. C. B. Brown—Sir: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it. Yours,

W. D. APLIN.

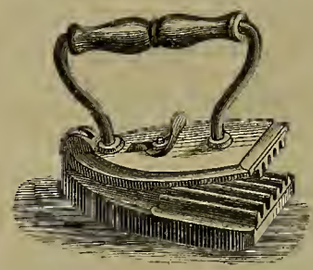
Little York, Nov. 5, 1872.

For further particulars, address,

fe22-tf C. B. BROWN, Placerville, Cal.

P. J. PHILLIPS & CO., No. 608 Clay street, near Montgomery, San Francisco, are agents for Brown's Lamp, where it may be seen.

Polishing and Fluting Iron.



This new invention takes the place of two articles needed in nearly every house. As a POLISHING IRON it has no superior. The part used for Fluting is made of brass, and highly polished. A Receipt for making French Glossing Starch, that gives a superior polish, goes with each iron. The Polishing Iron and Fluter, being in one, are both heated at the same time. We are now prepared to furnish them in quantities to suit.

Price, $3.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

Residence—308 Tenth street, Oakland, Cal. jn21-8m

(Continued from Page 5.)

ft. on the ledge with good indications—showing ore in bunches. Work is being steadily prosecnted.

RAYMOND EXTENSION.—This mine is situated nesr the Portsmouth; incline down 40 ft.; showing some ore. Working one shift.

ANDES.—In the same locality as the Raymond Extension and Portsmouth; incline down 65 ft. and showing a well-defined ledge with bunches of ore. Driving ahesd all the time.

ALPS.—The drift from the main shsft is now in 235 ft. without cutting the ledge. From the 154-ft. level rich ore is being constantly extracted. The vein at this point is 2 ft. wide, a portion of which, however, is not considered rich enough to mill at present.

MAZEPPA.—The hoisting works are nearly completed, and if nothing takes place to prevent it, another whistle will be sdded to our noisy stesm choir on Monday next. The works are first-class in every respect. Sinking on the msin shaft will be resnmed a s fast as the hoisting-works are ready.

RAYMOND AND ELY.—The usual amonnt of ore is being extrscted and shipped with the same uniformly good returns in the shspe of bullion.

PARIAN.—The incline on the ledge is down 100 ft., with a drift from the bottom of 30 ft., showing good mineral all the wsy. Work, which hss been suspended on this mine for some time, will soon be renewed.

PEAVINE.—Siill shipping ore from this mine. The usual number of men employed and character of oras unchsnged. We have seen some extrsordinarily rich ore from this mine lately.

HAVANA.—Incline shaft 200 ft. deep. Ledge in the bottom between 8 and 9 ft. wide, 2 ft. of which is extremely rich, the balance being low grade ore of good milling quality. The rich streak is steadily increasing in size as depth is attained. Five or six tons of high grade ore on the dump, and fifteen to twenty tons low grade. Still sinking.

NORTH STAR.—This new and promising mine is now down 15 ft. in the shaft. The vein holds its width and richness.

WASHINGTON AND CREOLE.—Shipped last week $6,300 —next week will ship between $6,000 and $7,000—shipments will herafter he msde weekly. They are now taking out sbout 10 tons a day—an average assay from which shows $160 to the ton. Another winze is being sunk, from which drifts are being run sast and west, the ledge averaging 2 ft. in width from top to bottom. In stoping up from the drift to the ledge, the average width in the drift stope is sbout 3 ft. This stope is 70 ft. long—running east and west from the main drift. Prospecting for new developments is going on as heretofore. The ontlook of this mine wss never better than at present. The June shipment will will be at lesst $30,000.

CHIEF OF THE HILL.—Have raised from the 160-ft. level—Wright's shaft—60 ft., and intend to drift therefrom to counect with the Chief of the Hill Esst. Before msking the counection, they expect, from previous indcstions, to strike a large body of ore.

SILVER PEAK.—The ore struck in the vein in the stopes is wider and richer than before. In one of the ore bressts this streak is 3 ft. wide—good milling ore, better than the last sent to the mill.

WASHOE.

BELCHER.—Dsily yield 500 tons, about 155 of which comes from the 1,300 or lowest level, through the Yellow Jacket shaft. The msin south drift at this level is in 280 ft. from the Crown Point line, with the fsce still in fine ore. The cross-cut east from the sill floor, 100 ft. from the Crown Point line, and the cross-cnt east from the fourth floor above, 70 ft. from the Cown Point line, are both in over 100 ft. from the esst side of the ore stopes, snd still show spots of ore. This level thus far shows better than either of the levels above, all of which, however, are looking and holding out finely. At the 1,200-ft. level the cross-cut east shows 39 ft. of fine ora, which hids fair to open out into a large body. The msin incline is now down below the 1,300-ft-level. A station is being opened for that level, and the incline will be continned downward as soon ss the station is opened and the drift north fairly started.

SAVAOE.—The south winze from the 1600 to to 1700-ft. levels msde the connection last Wednesday, giving a much-needed circulation of pure sir, cooling off the 1700-ft. level, and sffording an opportunity of crosscnting the ledge and developing the real vslue of that level. The north drift on the 1500-ft. level, having made connection with the Gould & Curry, slso gives a fine chance to prospect the large body of virgin ground thes lies between the 1500 snd 1600-ft. levels in that part of the mine.

SENATOR.—12 ft. have been added to the depth of the shaft this week, making it now 366 ft. deep. Some water is coming in at the north side of the shaft. It is of a milky color and quite wsrm. There is not enough of it, however, to give any trouble. The east side of the shaft shows the most quartz coming in. It is of fine quality. An assessment of 50 cents s share, amounting to $12,000, wss levied last Tuesday.

CROWN POINT.—Owing to the bad luck with the machinery, the ore production for the lsst week or two has not been up to the average, and what wss taken out csme from the 1000 and 1200-ft. levels, where the ore is of lower grade than at the 1300-ft. level. This difficulty is now obviated, the machinery being all right once mora and in good running condition. The cross-cnt esst of the 1300-ft. level, after passing through a rich streak of ore 14 ft. wide, 66 ft. from the drift, has gone some 23 ft. beyond, in porphyry and quartz, thst gives low assays. The cross-cnt east, at the lower or 1400-ft. level is in 65 ft., with the fsce still in solid white quartz, giving low sssays.

DAYTON.— The rock in the fsce of the main west tunnel, st the 225-ft. level, is much softer than at onr lsst report, and admits of much better speed in the progress of the work. The same heavy snd extensive qnartz ledge which was opened snd developed st the upper level of this miue in 1864-5, is found to extend to the lower level now being worked. It is much more concentrated, however, and contains mora good ore. It is over 100 ft. in width. The Dayton is one of the most valuable mines along the grest main lode.

CONSOLIDATED VIRGINIA.—Sinking the shaft is making steady progress, the rock in the bottom working well. It is now down 1,066 ft. Bnt little headway has been made in the main north drift on the 1,157-ft. level from the Gonld & Curry shaft during the week, owing to the striking of a hesvy flow of wster in the face of the drift of so hot a temperature as to mske it almost impossible for the men to prosecute the work.

LOWER COMSTOCK.—Gold Hill *News*, June 28: Work is actively resumed to develope the valusble claim of the Oo. situated on the lower portion of the branch of the great lode lesding down Gold Csnon. The clsim lies on the west side of the canon, within the limits of Silver City, and opposite the t wn. It is finely secured by United States patent, and various tunnels, run into it in times past from the ravine, have prstty well defined the position and value of the main ore vein, which is from 70 to 100 ft. wide. The quartz is of a fine character, and gives good assays. The old prospecting shaft of the Co. is 125 ft. in depth, and cut into quartz very much resembling the rich Ophir of years ago. There is every evidence to induce the belief that a rich, extensive and valuable mine will be developed when adequate depth is attained. With this view the Co. commenced last Saturday the sinking of a large working-shaft of three compartments, which, it is calculated, will cut the ledge at the depth of 500 ft. The first level will be opened at 400 ft. for a drift west of the ledge. Pay ore should, and probably will be found at that depth. The shaft is already 30 ft. deep, and the contract for the first 100 ft. is let to R. A. Yonng, of Silver Oity.

CROWN POINT EXTENSION.—This mine, adjoining the Crown Point and Belcher to the southward on the branch of the great lode leading down Gold Oanon, is now sbont to be practically opened and developed. The title is finally secnred by U. S. patent, and all things in that line being completed, the Co., on Mondsy last commenced sinking a large working shaft of three compartments. Mr. B. A. Yonng, of Silver Oity, has the contract for sinking the first 100 ft. It is slready down sbout 20 ft., making very good progress. Steam for hoisting works will be erected, with the intention of sinking to the depth of at least 1,000 ft., at which point it is expected to intersect the ledge. The new prospecting shaft of the Front Lode Mining Company being sunk a few hundred yards further down the canon, on the ssme lead, is 50 ft. deep, and already shows very favorable looking vein matter.

AMERICAN FLAT.—Sinking the incline is making good progress, with the bottom in quartz and porphyry. The ton having contracted with the Baltimore Consolidated for the privilege of running a drift from the main west tunnel on the 450-ft. level of thst mine, so as to cut the ledge and prospect their mine at a much less expense and are making good progress with the same.

FRANKLIN.—The clearing out and repairing of the main drift is still being vigorously driven ahead. Two shifts of men are employed, and they progress at the rate of two sets of timbers in three days. New ground and the ledge itself will be reached in the course of a week or ten days. Detached pieces of loose ore are frequently met with in the progress of the work, which give good assays. One piece last Wednesday assayed $124 26 to the ton, 25 par cent. of which wss gold.

IMPERIAL.—There is no particular change to note in the appearance or prcspects of the mine. Work goes on ss usual, snd evcrything operates well.

GOULD & CURRY.—The new pumps were all completed in good running order, and started np at six o'clock last evening. The msin northeast prospecting drift on the 1,500-ft. level is still driven ahead, the face in qusrtz and porphyry. The counection of the south drift on the 1,600-ft. level with the Savage gives the ssme ventilstion, and affords the opportunity to cross-cut and develop that portion of the mine.

WOODVILLE.—This mine continnes to yield well, keeping the mill stesdily running. The snit bronght against the Woodville by the Justice Co. is drawing toward a close. It is not a suit for title, as many have snpposed, bnt merely for trespass, the Justice alleging that the Woodvllle Co. have been gouging in upon them and taking ora from the Justice ground.

HALE AND NORCROSS.—Daily yield 50 tons of ore. Sinking the north winze, from the 1700-ft. level downward, is making good progress. The engine used on the 1500-ft. level to do the hoisting in the winze from the 1700 to the 1500-ft. levels, will be used to do the hoisting from this new winze.

SIERRA NEVADA.—Daily yield, 60 tons of ore. The ore breasts in the upper and middle portions of the mine are being gradually extended back further into the mountain, and continue to show an improvement in both the qusntity and quality of the ore extrscted. The mill is kept stesdily running on ora from the mine.

ARIZO A AND UTAH.—Sinking the winze in the main east drift on the 260-ft. level is making excellent progress, the face from the tunnel level downward continuing in good ores. Sinking the shaft has again been resumed, the rock in the bottom working well, and no water to interfere with the progress of the work.

OPHIR.—Prospecting at the lower levels still vigorously going on, hut no favora ble indications of large ore bodies are met with just at present. A great deal of work has been and still is doing in this mine, and to the depth of 1,500 ft. An assessment of $5 per share, amounting to $48,000 was levied last Mondsy.

MINT.—The main drift of the upper working is still being sctively driven ahesd, msking good progress, following the wsll of the ledge. A crosscut will be made into it shortly, when good results are anticipsted. Work at the lower level will be resnmed as soon as practicable.

OCCIDENTAL.—The ore-body in the main north tunnel is developing finely, being now from 16 to 18 ft. in width, and of excellent qnality. This mill will be started up on ore from the mine in a few days, when some good returns may be looked for.

JULIA.—The south drift from the msin west tunnel, on the 1,000-ft. level is making fair progress, the face sho wing some good ore. Work has again been resumed in the main east drift on the 800-ft. level. This drift is now in a distance of 550 ft.

JUSTICE.—The old south mine continues to yield about 20 tons per day. Drifting south st the 800-ft. level going on as usual, with favorable indications. An assessment of $1 per sbsre, smounting to $21,000 was levied last Tuesday.

CALEDONIA.—The 400-ft. level still continnes to yield 50 to 60 tons of good miling ore per day, keeping the Ssphire mill stesdily running. The main west drift at the 500-foot level is making good progress.

UTAH.—Draining the water from the shsft is ms king excellent progress, it being reduced to within 20 feet of the bottom. As soon ss the water is drsined, sinking the msin shaft will be resumed.

OVERMAN.—West drifts still going shesd, with no material change to report.

YELLOW JACKET.—Drifting north and sonth at both the 1,500 and 1,400-ft. levels. Only this and nothing more. No new developmenta.

Utah.

Salt Lake *Journal*, June 19: News from the new mining camp in the vicinity of Terrsce is more flattering than ever. A fourth part of one of the prospects was sold for $4,000 cash. The district can be trsced for over 6 miles, and a party of prospectors, who have just returned from s place 7 miles further on, have brought in ore of very high grade. A number of gentlemen of this city, who have visited the place, have "gone wild" ovar the prospect. Parties are now fitting out a stage line to counect the camp with the railroad. The indications for s flourishing, new district are good. High-grsde, frae milling ore, found within 10 miles of a railroad, in apparently inexhsnsible quantities, cannot but excite the sttention of miners.

Salt Lake *Tribune*, Jue 21: The principal mines now being worked in the district are the Del Monte, Silver World, Crown Point, Irvin, Terrace, Queen of the West, Silver Shield, May Flower, Forest Queen, Homestead, Midsummer, Silver Mountain, Central Pacific, Argants, and the Nellie Grant. The general character of the ore is represented to be high-grsde galena, with copper, selected samples averaging $300 in silver, 50 per cent. in lead, 10 per cent. in copper, and $27 in gold to the ton. All the sbove-named mines are mora or less developed. But the Mayflower snd Del Monte are prominent in that respect. The former hss a shaft down 50 feet, which is intended to tap the ledge st an incline of 100 ft. The Del Monte has an incline down 60 feet, and ore is being taken out all the wsy down. A ssmple of ore from the bottom of this incline assayed about $800 silver to the ton.

ROSEBUD MINES.—Salt Lake *Journal*, Jnne 23: A private letter received to-day by Messrs. A. S. Gould & Son, dated Rosebud, June 22, contains the following:

We have just got a prospect about five miles from here that will prove the best yet. An Indian came into camp with some rock and offered to show us the ledge for two horses; as we had no horses to give him, we gave him thirty dollars and a pair of blankets. He took us to the ledge five miles from hera, it is ahout twelve feet wide, and looks first rate. We had one assay from the surface, it went $165.40 per ton. I was up there yesterday, and organized a new district, called Shoshone district.

THE WINDSOR MINES.—This splendid group in Little Cottonwood, consisting of the Hiawatha, Montezuma, Last Chance and Savage, is looking magnificently. Steady work has been going on in them during the winter, and large bodies of ore have been developed. The dump is well filled, and with the facilities now enjoyed by the completion of the tunnel no doubt the mines will be placed upon a dividend paying basis within 30 days after the roads will permit the shipment of ore.

New Incorporations

The following companies have filed certificatees of incorporation in the County Clerk's office, S. F.

BLACK MOUNTAIN COAL M. Co.—June 27. Location, State of California. Capital stock, $1,00C,000. Trustees —Isham Case, William Strader, C. B. Burroughs, M. Bankhesd and George H. Smith.

CLIFTON COAL M. Co. was also incorporated, having the same amount of capital stock, objects and trustees.

AMADOR CANAL AND MINING Co —June 30. Object—To construct and maintain cansls and ditches in Amador, Calaveras and other counties, for flosting wood and lumbar snd to supply wster for mining and agricnltural purposes. Capital stock, $500,000. Directors—Abner Doble, Frsnk M. Brown, Joseph S. Emery, R. Thompson and G. M. Condle.

ROCKY POINT G. M. Co.—June 30. Locstion: Sierra county. Capital stock, $4,000,000. Directors—F. Jacob Wissing, J. B. White, Geo. Loomis, Wm. Pickett and Joseph Atwell.

WM. SHAKESPEARE G. M. Co.—July 1. Location: Farlestown Mining Dist., Butte Co. Capital, $1,500,000. Trustees—R. A. Hawkins, J. S. Allen and Wm. M. Rider.

PIONEER FLUMING Co.—July 1. Location: Shirt-Tail Canon, Plscer Co., Cal. Capital, $2,400,000. Trustees—J. M. Taylor, Maurice Dore, I. J. Corrigan, Arthur K. Hawkins and T. B. Kent.

THE BENJAMIN G. & S. M. Co. has filed a certificate of the increase of its capital stock to $3,000,000 from $2,000,000.

CONTINENTAL LIFE INSURANCE Co., No. 302 Montgomery street, corner of Pine.

And in accordance with law, and an order of the Board of Directors, made on the 7th day of May, 1873, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 314 California street, San Francisco, California, on the 12th day of July, 1873, at the hour of 1 o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. LOUIS FRANCONI, Secretary.

Office, No. 314 California street, San Francisco, California. jun14

Omega Table Mountain Mining Company.

Location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of June, 1873, an assessment (No. 2) of Five Cents per scare was levied upon the capital stock of the Corporation, payable immediately, in United States gold and silver coin, to the Secretary, at No. 28 Merchants' Exchange, San Francisco, California. Any stock upon which this assessmant shall remain unpaid on the 5th day of July, 1873, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on the 28th day of July, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Directors.

DAVID WILDER, Secretary.

Office, No. 28 Merchants' Exchange, California street, San Francisco, California. j6-4w

Orient Silver Mining Company-- Location

of principal place of business, San Francisco, California. Location of works, Ely Mining District, Lincoln County, Nevada.

Notice is hereby given, that at a meeting of the Directors, held on the 14th day of June, 1873, an assessment (No. 2) of Ten Cents per share was levied upon the capital stock of the Corporation, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, Room No. 25, Hayward's Building, No. 419 California street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of July, 1873, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 11th day of August, 1873, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

JOSEPH MAGUIRE, Secretary.

Office, Room No. 25, Hayward's Building, No. 419 California street, San Francisco, California. jl5

Regent Consolidated Mining Company—

Location of principal place of business, San Francisco, California. Location of works, Little Cottonwood District, Salt Lake County, Utah Territory.

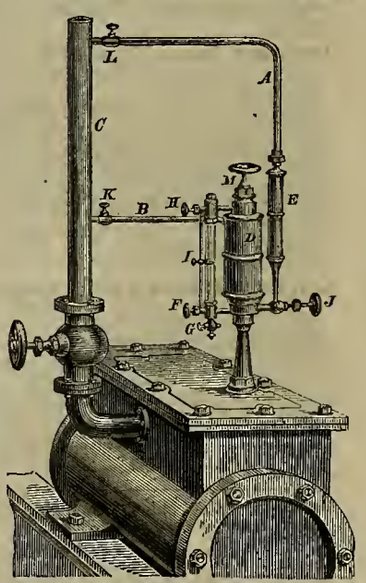
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

SAN FRANCISCO GOLD AND SILVER PLATING WORKS, 655 Mission street, San Francisco.

2v25-3m E. G. DENNISTON, Proprietor.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

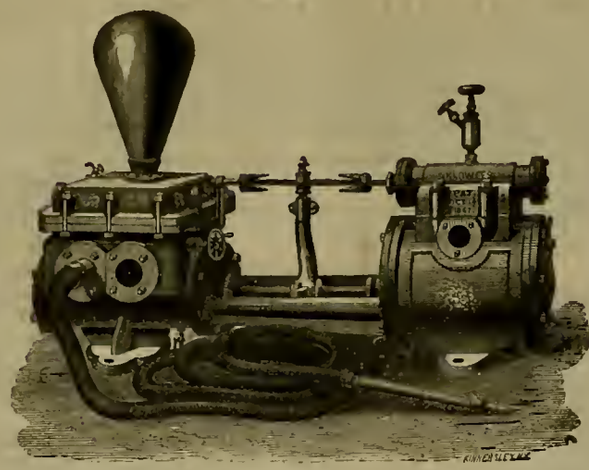
KNOWLES' PATENT STEAM PUMP.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylinder is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, Cal., January 14, 1873.

A. L. FISH, Esq., Agent of the Knowles Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on the road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

U. S. NAVY YARD, NEW YORK, June 3, 1871.

MESSRS. KNOWLES & STEARLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully, WM. W. WOOD.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a FIRST PREMIUM and Diploma, awarded to the Knowles Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A..... .....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Neequahoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.

Laws Concerning Corporations.

[Under the New Code—January 1, 1873.]

GENERAL PROVISIONS APPLICABLE TO ALL CORPORATIONS.
WAGON ROAD CORPORATIONS.
WATER AND CANAL CORPORATIONS.
HOMESTEAD CORPORATIONS.
MINING CORPORATIONS.
LAND AND BUILDING CORPORATIONS
ALSO, MINING PARTNERSHIP LAW.

A pamphlet containing the above provisions concerning Corporations has been printed from the Statutes of California. It furnishes those who wish these special laws an opportunity of obtaining them for the small sum of 25 cents (post paid). Address, DEWEY & Co., Publishers, and Patent Agents, S. F.

L. P. McCARTY, corresponding agent for the MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, ILLUSTRATED PRESS and the JOURNAL OF COMMERCE, is sojourning in this county a few days canvassing for subscribers for these publications. These papers are first-class and well conducted, and the information derived from them is of a sterling character and well suited to the requirements of the mountain population. Mr. McCarty was formerly a resident of this county, is a live agent, and his representations as to the character of these journals may be relied on.—*Democrat, Sonora.*

And, in accordance with law, and an order of the Board of Directors, made on the 27th day of May, 1873, so many shares of each parcel of said Stock as may be necessary, will be sold at public auction at the office of the Company, No. 414 California street, San Francisco, California, on Monday the 21st day of July, 1873, at the hour of one o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. WEGENER, Secretary.

Office, 414 California street, San Francisco, California.

SWISS AMERICAN BANK,

Incorporated in Geneva, Switzerland, January 20th, 1873.

HEAD OFFICE, IN GENEVA.

CAPITAL, TWO MILLION DOLLARS

SUBSCRIBED.—ONE-QUARTER PAID UP.

PRESIDENT.....HENRY HENTSCH.

SAN FRANCISCO BRANCH,

SUCCESSORS TO MESSRS. HENTSCH & BERTON,
527 CLAY STREET, S. F.

Directors:

FRANCIS BERTON, ROBERT WATT.

This Bank is prepared to grant Letters of Credit on Europe, and to transact every kind of Banking, Mercantile and Exchange Business, and to negotiate American Securities in Europe. Deposits received.

BILLS OF EXCHANGE ON:

New York,	Hamburg,	Winterthur,	Basel,
Liverpool,	Bellinzona,	Bern,	Chur,
London,	Berlin,	Neuchatel,	Shaffhausen,
Paris,	Frankfort,	Locarno,	Fribourg,
Lyons,	Geneva,	Chaux-de-	Lucern,
Bordeaux,	Zurich,	Fonds,	Aarau,
Marseilles,	Basel,	Solothurn,	Lugano,
Brussels,	St. Gall,	Lausanne,	Mendrisio.

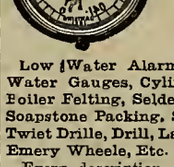
An Assay Office

Is annexed to the Bank. Assays of gold, silver, quartz, ores and salphurets. Returns in coin or bars, at the option of the depositor. Advances made on bullion and ores.

Dust and bullion can be forwarded from any part of the country, and returns made through Wells, Fargo & Co.; or by checks. 1v27-3m

Ashcroft's Patent Steam Gauges,

(Original—with Bourdon Spring).



Steam Gauges,
Vacuum Gauges,
Registering Gauges,
Test Gauges.

Low Water Alarms, Gauge Cocks, Glass Water Gauges, Cylinder Cups, Self-Oilers, Boiler Felting, Selden'e, Tuck'e, Hemp and Soapstone Packing, Stocks, Tape and Dies, Twist Drills, Drill, Lathe and Planer Chucks, Emery Wheels, Etc.

Every description of Engineers' and Machinists' supplies, for sale by

TREADWELL & CO., San Francisco.

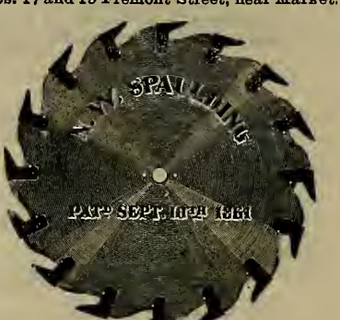
Saw Smithing and Repairing

ESTABLISHMENT.

Nos. 17 and 19 Fremont Street, near Market.



MANUFACTURER OF

SPAULDING'S

Patent Tooth Circular Saws.

They have proved to be the most durable and economical Saws in the World.

Each Saw is Warranted in every respect.

Particular attention paid to construction of

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE

At the lowest Market Prices.

HALLIDIE'S Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companiss, Civil Enginsers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Fretburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,
Little Cottonwood, Utah.
Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit across over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. At the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 112 and 114 California St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 12, 1873.

VOLUME XXVII. Number 2.

Rickard's Improved Ore-Washer and Amalgamator.

By referring to onr cut, illustrating this invention, the *modus operandi* of the machine will be at once understood.

A ie a tank of iron, or other snitable material, through which water is conetantly flowing, and into which the crude pulp is thrown. A shaft, passing through the drum, carries adjustable discs, *b*, *b*, c, c, *f*, *f*, made alternately of copper and galvanized iron. By using theee metals in combination, an electric current is engendered, which, it is claimed, will greatly facilitate the process of treatment. The discs are twisted on the shaft at any desired angle; or may be worked in pairs, inclined toward each other, giving a V form; or crossed, making an X section. These two latter arrangemente prodnce what is known as the "fish-tail" and "donble fish-tail" motione, when the discs are rotated. For washing ores, the pulp is simply fed from above; paeeee between the plates and is thoroughly agitated, the silt being washed off through a waste-way; while the heavier portion containing the free metal, sulphidee, etc., is collected at the bottom. When the machine ie used as an amalgamator, the copper plates are covered with the usual amalgam of mercury, which absorbs and retains the fine metallic particles, while the refuse ie carried away.

This form of ore-washer wae patented recently by Mr. W. F. Rickard, of Monitor, Alpine county, California, through the patent agency of the MINING AND SCIENTIFIC PRESS. It is deeigned to work on pulp containing free metal, the heavy sulphides, tailings and ores generally, as a washer and concentrator; to amalgamate, as stated above; and in a modified form is adapted to the mannfactnre of bntter, the fish-tail motion rendering it an admirable churn. The mode of attaching the agitating discs is the striking peculiarity and the etrong point of the invention.

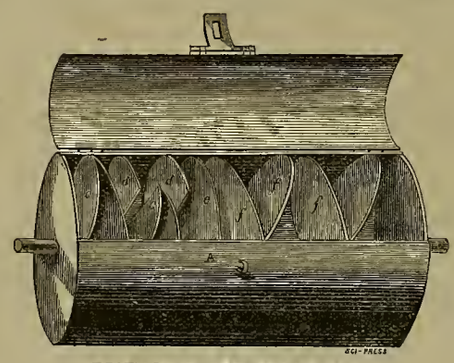
A DAM is to be bnilt at the lower end of Fordyce Valley, by the South Yuba Canal Company, which will give them an unlimited eupply of water through the entire season. The company, according to the *Transcript*, have now four artificial lakes, and thie new one will hold three times ae much as all the others. The dam will be of rock, and 650 feet across the top, at the hight of 50 feet; at the hight of 75 feet it will be 750 feet on top. After this dam is finished, the minere who get their water from the Sonth Yuba Company will have all the water they want.

NEW CANAL.—The new Canal of the Spring Valley Canal and Mining Company, at Cherokee Flat, was completed on the 5th inst., and at 6 P. M. the water wae in the discharging arm of the Dogtown pipe and flowed through towards Concow. This work, including 4,500 feet of thirty-inch pipe, a portion crossing a depression six hundred feet in depth, and eight milee of canal, eight ft. in width, has been pushed through in ninety days, at a cost of $75,000, and the Company will now have an almost unlimited eupply of water throughout the entire year.

IDAHO MINES.—Thomae Mootry, Jr., writes us from Placerville, Boise, Idaho, that the placer mines are doing well, and that water is plenty. There are no idle men, and a good yield of gold is expected from all parts of the Basin. He says his mill and miue are doing first-rate; they are running 25 stamps on good ore, and plenty of it.

Artificial Marble.

The enterprise of manufacturiug marble by a patented procese was inaugurated in California by the Manhattan Marble Company, a few monthe since, and they are now in full ruuuiug order. We paid a short vieit to the factory in Oakland this week, to see what they were doing. The main building in which the marble is made, is 160x30 feet, and at present some twelve men are employed. Tho procees of manufactnre is the invention of Mr. Frear, of Chicago, the patentee of the Frear Stone. A peculiar gypeum, called Keene's cement, which is made in Eugland, is the basis of the eubetance, and the patented solution ie employed to make a combination, which produces a hard and durable imitation of marble for useful and ornamental purposes. It is formed into a pasty mass, about the consistency of dough, and is run into moulds in which it remains about 24 hours. It "sets" rapidly and when hardened is romovod and exposed to the air for a ehort time. Before drying, the imperfectione in the eurface are removed by the application of sufficient of the eoft subetance forming the marble. The marble ie then taken to a drying room, which is kept at a temperature of about 100°, aud remains there for a week's time. It ie then put through the process of polishing aud cleaning.



RICKARD'S ORE WASHER.

The principal articles manufactured are mantels, tahles, table-tops, tiling for floors, etc., numerons samples of which are exhibited at the office of the company, No. 319 Pine street, in this city. The proportion and character of the eeveral ingredients, used in makiug the marhle, can be varied so as to produce variegated marbles of any desired color. The coloring material is added to the composition when iu a plastic state, or to the eolution with which it ie moistened, and beautiful imitations of all varieties of marble are obtaiued. Among the varieties imitated successfully, we may mention Malachite, Sieuna, Brocatello, Formosa, Tenneesee, Waunooska, Levantel, Lapis-Lazuli, Italian, Jasper, Verd-antique, Lisbon and Bardiglio. The Malachite, particularly, is a very correct representation, as in fact are all tho imitations. The marble is beautifully grained, aud in the colored varietiee the grain is seen to go clear through.

These variegated and colored marblee are all more or less expeueive and rare, when real, but the imitation can he manufactured at greatly reduced rates. As yot the demand for them is limited, since people on this coast are accustomed to use white marhle ouly, and many believe that no euch stone exists as is imitated by soveral patterne shown. Their iutroduction however is only a matter of time, as they really make handsome as well as useful ornaments and the prejndice against the color will rapidly wear away. The marhles all have a high polish which it is claimed is as durable ae that given to the real substance. One advantage claimed for the manufactured material over the natural, aside from cheapness, is the fact that inkstains, which go all the way through iu the latter and are difficult to remove, can easily be washed off of the artificial marble. Smoke, which stains white marble, can he easily washed off from this eubstanco.

As the demand for the artificial marble becomes greater, the company inteud increaeing their facilitiee proportionately. The factory is a fine, large building, well lighted aud ventilated and in a conveuient situation for shipping to the interior, being on the line of the railroad. All the patterns used are made at the factory. It is well worth a vieit to the office to eee tho varieties of marble made, some of them heing exceedingly beautiful. Of course the artificial product is furnished at a much cheaper rate than natural marble; the more elaborate the design, the cheaper it is proportionately. As it is all moulded while in a plastic etate, it naturally costs lees to produce than marble upon which the designs muet be cut by hand with mallet and chisel. The grain is quite fine, making it susceptiblo of a high polish. It can be readily understood that, with the capacity of making any kind and color of marble, there is more scope in design than ie usually the case, and the colors can be harmouiously blended to suit any taste or fancy. Nor does it require any argument to prove, after seeing how it is made, that this marble can be sold cheaper than the natural substance. It is probable that before long an exteneive trade in artificial marble will epriug up ae ite economy becomes known and the uses to whicb it may be put are extended. This factory is one more addition to the mannfacturing establishments of our State.

A MINER workiug in a claim in Calaveras county, who hae been running a tunnel for three years in hard bed rock, and got in 800 feet, had to quit on account of ill-health, and sold out. He went to work for wages for the new proprietors and in three weeks struck the gravel channel he had been looking for so long.

QUICK TEAMING.—The Pioche *Record* says, Jackson's mule teams (ten animals to each team and each drawing three wagone) came from Toano to Pioche in ten days and five hours. They were loaded with merchandise. This is the quickest time ever made botween Toano and Pioche hy loaded teams.

The Indian Troubles in Arizona.

The Apaches in Arizona are again on the war-path, and their signal fires are visible in the mountains about Tucson. They are, as nsual, well armed and equipped and ready to do ae much damage ae possible. This is a good time to send some of the advocates of "peace policy" to Arizona to get an idea of the "situation" iu that region. As their "situation" is, however, uenally in a political office, or a strong fort, or under a good guard when traveling, they might not comprehend the subject properly, nor see it in the same light as the eettlers do. Dispatches from Tucson wonld indicate that the Indians have better facilities for conveying information than the military.

During the late temporary peace the Indians have had the freedom of the conntry and know the situation of every cabin; and it is probable that death and destruction will be dealt out to the settlers and their effects, with more serions results than ever before. These Indians were whipped into submission by General Crook, the only man who has been able to do it; and they were then put on the reservatioue where they had nothing to do; were fed and clothed, and had arms and ammunition given to them. The general's peace policy ie extermination, and that is probably what it will come to in the end, after all the peace commissionere and army contractors bave filled their pockets. This policy has been a failure with the Apaches ever siuce it was first inaugurated; and how much longer it will be continued, depends, probably, on the longevity of the tribes, and the supply of money in the United States Treasnry. If General Crook gets permission to "go for" those redskins again, in his own way, it would not be a bad idea for the settlere, ae there is no telegraph, to intercept all messages and messengers from the outside world nntil he has a chance to "clean out" all the Indians. By thie meaue no word could be sent to Geueral Crook, until he had given them a sonnd thrashing and an idea of the powor of the Government. There is one conealation, however. No Peace Commissioners will be likely to risk their precious skine in Arizona just now, at least not in proximity to the Indians.

We want to eee a rapid settlement of this Indian question in Arizona, as it ie without doubt one of the richest Territories in the United States fn mineral wealth. Men are now sitting idly on dumpe of ore worth thoueands of dollars, which are of no value to them, as there are no mills to crush it, and capitaliste will not invest in the country while Indian disturbancee are eo frequent and dangerous. The fact that the mines now there can afford to ship ore, over a rough aud circuitous route at great expense, to this city for reduction, is sufficient guarantee of the mineral wealth of the Territory, and an indication of what could be done under favorable circumstances.

ENGLISH CAPITALISTS propose promoting railroad enterprise in China. It is in contemplation to furnish a gift of rolliug stock and ten milee of road, with a view to induce the Emperor to sanction a net-work of railroads. Half of the capital stock has heen subscribed, and the rest is expected. A call for a publie meeting has heen ieeued, undor the auspices of the Lord Mayor of London.

BULLION.—Over 65,000 bare of Cerro Gordo hullion paseed over the Los Angeles and Wilmington railroad last year, aud the Loe Augeles *Star* says there will be a material rise in this figure the ensuing year.

CORRESPONDENCE.

Notes of Travel in Eureka and Elko Counties, Nevada.

[By our Traveling Correspondent.]

Palisade.

The point of our first divergence from the C. P. R. R., to visit the mines of Esstern Nevada, is located st a pcint on the Humboldt River, where Pine Creek empties into the ssme, and 573 miles esst of your city, and is situated at an elevation of a little over 4,000 feet above the sea level. Pallsade contains about 150 inhabitants, and in the new county of Eureka; out off of Lander County by an act of the last Legislature. It is important as a point of divergence from the C. P. R. R., to nearly all of the mines of Eastern Nevada. From this point, where you arrive on the afternoon of the second day out from San Francisco, at 3:12 P.M., you take stages of

Woodruff & Ennor,

For Mineral Hill, Eureka, Hamilton, Treasure City, Eberhardt and Pioche.

They are among the oldest stage men in this State, and own three separate stage lines; viz: Virgina City, Schell Creek and White Pine which is the name of the one between Palisade and Hamilton, and is 125 miles in length. Three sets of careful drivers manipulate the reins between these two points, and thirteen changes of horses are used, six to each team; fine Concord coaches are used, and the time occupied in transit between Palisade and Hamilton is from 22 to 23 hours; fare, $25.

Mineral Hill

In Elko County Nev., is the first mining camp met with on this route; it is located 35 miles nearly south of Palisade, at an elevation above tide-water of 6,100 feet. It contains about 250 inhabitants, has one hotel, saloon and blacksmith shop, and four mercantile establishments. To show the liberality and patriotism of Mineral Hill, $600 in coin has been collected to celebrate the Fourth of July with, and it is scarcely yet one year, since a terrible fire swept the entire town away, with a very slight insurance. The following are the principle mines of that district.

Mineral Hill Silver Mining Co.,

(Limited) is an incorporation of English capital, the works and mines of which are located at Mineral Hill, Elko county, Nevada, of which I spoke at length in my letter to the PRESS July 20th, 1872. Some changes (local) have takeu place since my lsst visit to this company's works, but noue of note. Mr. H. H. Oakes is still the Superintendent.

This company was incorporated in the year 1871, since which time they have extracted and shipped $1,072,000 in bullion, being a yield of $392,000 since my last visit a twelve month since.

This corporation are at present working 60 men in their mines, and are crushing all the ore they extract at their Attwood mill, which hae fifteen stamps ruuning by steam, and reduces from fifteen to twenty tons per day, according to the hardness of the rock.

The Taylor Mill.

The new 20-stamp mill owned by this company, has been lying idle for twelve months past; in fact, they only run it some two months after it was completed. It is a very fine structure and cost tbis company some $135,000 to erect; it is now on sale and several parties have signified their intention to purchase the same. It is a splendid mill to any company tbat have use for it. This corporation uave no need for any more than fifteen stamps, which they have in their Attwood mill.

The mines of this company do not look so flattering as they did one year ago, but economy in accordance has been introduced, in the several departments by Superintendent Oakes, and mining agent F. Hoskins.

The Spencer and Austin Mines

Are working two or three men each, extraoting some good ore, but are not driving their work on acccount of having no mill of their own, and the high price of reducing ores charged by the custom mills, which, I understand, is $35 per ton.

Hardscrabble District

Is a uew district, located April 15th, this year, and is situated about five miles east of Mineral Hill; Dr. Hanson and R. H. Haysman I learn were the locators, and also present owners of the

Clarendon Mine,

The first discovered in this district. This mine lies in slate formation, with regularly defined walls. The course of this ledge and pitch is that of all the prominent lodes of this country, and has the appearance of a permanent one. It is being developed by a tunnel now in sixty-five feet, at which point it is forty feet to the surface, and shows a ledge of free milling silver ore six feet thick; from some ten assays made it shows an average of $100 per ton. The general character of the ore of this district, however is base metal and of a limestone formation, in a belt of quartzite, where the mineral is found ruuning north and south near the base of the mountains, and pitohos eastward at an angle of forty-five degrees, the width of which has not yet beeu obtained. Located in this latter formstion and prominent among those now being developed is the

Waverly Mine,

Located and owned by Mitchell, Rosenthsl & Co. This mine has been developed to a depth af 25 feet by a shaft, and a contract for sinking 25 feet more hss just been let; from 10 different assays from the average ores of this mine, it is shown that it contains about $30 per ton in silver besides the lead—the definite amount of which has not yet been ascertained. It is certainly a very promising mine; about one mile south of the Waverly is located the Stars and Stripes miue, which is being vigorouely worked at this writing, and ssssys well in silver. A little north of the Waverly mine is located the

Maricopa Mine

Similar in character to the above iu every respect, and is being developed by a deep open cut, and shaft. This company are working 3 men, their rock averages $30 per ton in silver. It is owned by parties resident at Eureka, and superintended by Mr. Hadley, one of the original locators.

L. P. Mc.

Cherry Creek Mines.

George W. Doane, one of the most persistent and reliable prospectors in Nevada, has returned from a trip to Cherry Creek and vicinity, and exhibited to the White Pine *News* some specimens found by him in that locality. The *News* has no hesitation in pronouncing the rock exhibited the richest that any section ever produced, and its similarity in general appearance to that found in the Comstock, leads us to the belief that a rich camp has been discovered. The presence of particles of pure gold and silver, in different varieties of rock, prove its richness, and the quartz formation in which it is imbedded adds additional proofs as to its extent and permanent value. George tells as that a great many miners, prospectors and speculators are daily making their appearance in the new camp; and all express unbounded faith in its future. The towns, foundations of two of which have been laid, are being built up with stores, residences, and the various adjuncts to a mining camp, as rapidly as lumber can be obtained for the purpose, and present appesrances denote a large camp in the future. Among tbe lucky owners of miuing claims there are Hunter & Briggs, the original locators of the district, and who are well known as former owners of the ranch 12 miles west from Eureka, now the property of Billy Nichols. They are made of the right kind of stuff to open up a new district, and are said to have faith enough in their new possessions to spend every "quarter of a dollar" on its development. Accommodatious for man and beast are said to be plentiful, and of the best quality. Mollinelli, of Austin and Schell Creek fame, has established a branch of his hotel there. The lumber used for building purposes is being supplied by Sanford Hall and partner, and the capacity of their mill, although kept running night and day, is not sufficient to supply the demand. Situsted so near splendid milling facilities, Esgle Cañon being only five miles from them, the owners of the mines caunot possibly fail to make a good thing from shipment of ores this season. We have every faith in the success of this district, and before snow again flies, we are confident of being able to chronicle many sales of mining grounds there and good results to purchasers of the same. Eastern Nevada is in a fair way to redeem itself among mining men, and White Pine county will yet foot up in wealth and population equal to any in the State.

New Mines at Sitka.

The quartz brought down here from Sitka by the passengers aboard the "California," and some of the crew of the same vessel, has been subjected to a rigid test by Captain Fisk, and a portion of it has proved to be quite rich. The specimens sent to Major Wood, the Adjutant-General of this Department, yielded at the rate of $100.45 per ton for the poorest rock and $276.15 for the best. This would readily prove the value of the mines, for the specimens have been takeu entirely from the surfaoe.

Another specimen of rock, somewhat different to the preceding, failed to yield any metal to the test; so that the region it was taken from must prove valueless in minerals.

Major Wood and half-a-dozen others have formed a Company for the development of their mine, and work will be commenced as soon as capital enough has been secured.

Some splendid copper mines have beeu discovered at Fort Wrangell, and they are said to be as valuable as auy yet found on the coast. A telegram received from San Francisco last evening, by Purser Goodhue, of the "California," stated that the assay of this copper would make it worth from $60 to $90 per ton. Should the whole prove as valuable as the specimens tested, the mine must be exceedingly rich, and, of course, highly remunerative to those having the energy and capital to work it.

At Galena a mine has also been discovered, some twenty miles from Vancouver. An analysis proved that it contained only seven per cent. of galena, the remainder being principally silicates aud kindred matter; but it contained silver enough to be worth $20 per ton.

The discoverer has resumed prospecting, and if a mine which has minerals containing fifty per cent. of galena is found, a company will be organized here to work it.—*Portland Bulletin.*

Supply of Nickel.

Those bodies cslled metals, which in one form or other of combination constitute an immense preportion of the whole mass of our globe, and whose number as elementary bodies classified by the chemist, far exceeds that of all other supposed elementary bodies, are by their unusually varied physical and chemical properties of the very highest value to mankind; yet it would be short-witted wisdom to say that they are the most importsnt bodies known to us. The metalloids are reslly just as important, for without their help the metals, in whstever state we found them, would prove intractable. The metals force themselves upon the notice of the most ignorant; the value of the metalloids is only seen through the medium of chemistry. It is a subject of curious interest, and not devoid of usefulness, to notice how the distribution and the chemical and physical proportions of the various metals influence their oost—quite apart from mere fluctuations of market value due to the course of trade. How abundantly is eaoh to be found in any state—how easily, or with what difficulty is it got into the metallic state from natural combinations—or how into new combiuations to become valuable? When reduced to regulus, what are its properties? Is it hard, rigid, tough, or soft, easy or hard to fuse? Is it beautiful aud glittering? Does it tarnish or rust? Does it alloy valuably with other metals? All these, and the answers to a hundred like questions, are involved iu the inquiry as to any known metal. What is its value as a material, and thence presumably in the market? Gold and platinum, through the combinatiou of their scarcity and their respective special properties, are called precious metals. Although we have in these latter days tracked the gold to its home in the quartz rock, we fiud it everywhere scattered iu fragments relatively so small and widely diffused, tbat the cost of its segregation largely enters into, and often equals or exceeds the current or standard values of the metal, and its value in the market has decreased with the increased abundance drawn from California and Australia. But its chief uses are for coin and objects of luxury, and were new sources of gold discovered, such as to increase a thousand fold the supply, it is difficult to see other uses of very great value to which it could be put. Its price would, therefore, probably rapidly decline, and the chief effect of such a discovery might be to derange, through its influence as a standard of value, the markets of the world.

Not so platinum. The total annual product is vastly below that of gold, and its price per pound is also much the lower. Why is this so, for except its beauty, it possesses most of the valuable properties of gold; aud some besides special to itself? The answer is, there are but few and small uses to which platinum has ever been applied. Yet to what endless and important uses in the arts, in chemical manufactures, in metallurgy, iu cookery, even in architecture and shipbuilding, might we not apply this metal were its supply to become sufficieutly abundant. But there is no prospect or even hope of this, and so the parsimony of its distribution rendes this metal, though scarcer than gold, and though unique in its combination of valuable properties, a declining one and below that of gold. This is even more certainly true of those ourious metals that, in excessively small proportions, accompany platinum in its crude state as worked from the sand. Palladium, rhodium, iridium, osmium, etc., may be said to be almost without use; their scarcity forbids any attempts to find a use for them—hence they have no real value.

Their price depends upon circumstances as factitious as those which make to the *dilletante* that of a unique engraved agate. With the exception of iron all the much-employed metals, lead, copper, zinc, and tin, are very easily smelted, and their ores, (excepting those of tin) largely and widely diffused. Hence, great as is their value, vast as is the demand for them, their prices within moderate periods of time remain pretty steady so far as natural causes are concerned, and only vary much through the intervention of fiscal causes. In a different class stands iron, and may one day stand alluminium. In the state chiefly of oxides both are found scattered broadcast as the dust beneath our feet. But oxides are terribly stable compounds in both cases, and in both the price is mainly dependent on the cost of isolation from the ore. This cost is larger even still with iron, considering the scale on which it is worked, but in the case of aluminium it is almost prohibitory—involving as it does the previous isolation of nearly the most oxidable metal known, sodium. Yet should means be found hereafter, as it is probable they will be, to reduce it as readily as iron, the metallurgy of alluminium may yet play a great part in the world. What numberless and important uses could this metal be put to; possessing the tenacity nearly of iron with the lightness of glass; malleable, ductile, difficult of fusibility, and at common temperatures showing—small tendency to combine either with oxygen or sulphur.

Again, viewed in this compound aspect of their determinants of value and of price, manganese, chromium, cobalt and nickel, may be classed together. Of the first the natural supply is practically boundless, but the difficulty in reducing it to metal, the high fusing point, and the great affinity for oxygen, have bitherto prevented its physical properties becoming sensibly and fully known. Its uses as a metal are few and its value small, while its price is higb. But cobalt, chromium, and nickel form that curious group of metals of which the natural distribution is sparse and rare; their uses few but important and well ascertained, and the price necessarily high. Cobslt and chromium may be said to so far have no value in their metsllic state—the coloring powers of their combinations constituting their chief value, which is enough, however, to maintain a high market price for both, but especially for chromium. Like titsnium, the uses of which are widely diffused—vsnsdum, and indeed a large catalogue of others—it is more than doubtful whether cobalt or chromium have ever been seen in a state of metsllic purity. It would be worthy of national expenditure to make on several of these little known metals extensive experiments as to their isolstion in purity, and their physical and useful properties so, aud ss alloyed.

We have been led to these remarks by the snnouncement lately made that the price of nickel had advanced so considerably as to hamper the manufactnre of German silver, and that should it further advanee to 30s. per pound, that trade would for a time be stoped. Nickel is obtained in commerce chiefly from kupper nickel, and from speiss, a sulpho-arsenate of uickel, and other metals, produced in the processes for obtainiug cobalt. For long it was neglected as a useless and unknown pest to the copper miner, whence its name; but at length one use for it was found—namely, to whiten the alloy of copper aud zinc so as to form German silver. To the present time, notwithstanding that the meaus have peeu found by M. Gaiffe, of Paris, to deposit pure nickel by the electrotype, it may be said to have but this one use in the arts. Its price was, we believe, at one time no more than 3s. or so per pound. What has produced the scarcity? In a small way this is an inquiry of as much interest as that of ooal.

The peopling of "the lone lands" of the New World and of Australia, the spread of wealth and desire for comfort everywhere, have uo doubt tended to expand the German silver trade into a very large one, which has been fostered and helped by electro-plating—a rather later developed art. But is it through demand overtaking supply that the great enhancement of price has risen? We should like much to be made sure of this iu the first place. It ougbt not to be forgotteu that there are a few of the metals, amongst which is uickel, that by reason of their comparative rarity and relations to the arts readily lend themselves to a monopoly eveu in the hands of a single large capitalist. Quicksilver wae made such a monopoly of by the Rothschilds some years ago, and the attempt was revived only two or three years since, but Californiau supplies had made it more difficult.

Bismuth, a metal produced in extremely small quantity, even since Australiau ores have supplemented those of Europe, yet of great importance to some arts as increasing the fusibility of alloys, is also one that has admitted of a monopoly, raising its price to a guinea per ℔. Is nickel now included in the category? If it be not, if the price be really due only to scarcity in proportion to the demand of the German silver trade, then ought those interested to bestir themselves in finding new supplies of the ores. Nickel is always an accompaniment of the palaeozoic and so-called ozoic rocks. Some of its most valuable minerals have been fouud in large quantity in the Lacustrian rocks of Canada, and there is good reason to believe it to extend in larger quantities to the north of the "Lake of the Woods," and in other places in British North America. "A prospecting" of these and other places would be now opportune.

It has long beeu currently stated, that Dr. Percy many years ago, when engaged by the firm or Evans & Asker, of Birmingham, in experiments made professionally for them on the production of German silver, fouud that manganese could be substituted for the nickel, and this rumor of scientific circles has received confirmation by a recent letter under the well-known signiture of "Y" in the *Times*, wherein the writer urges the substitution to be now made, which it is alleged was ouly preveuted before by trado considerations. If it be so, by all means let the metallurgist at once set to work to circumvent Nature's niggard supply, or the monopolist, wherever it be, just in the same way as King Bomba's sulphur monopoly came to an end uuder the domineering influence of pyrites. We confess, however, we do not anticipate very much here from manganese.

The fact that this last metal will *whiten* the alloys of copper and zinc was, if we be not mistaken, known from the days of Achard in Germany, but its power to prodnce a uuiform, staple tough alloy in substitution of uickel is quite another thing. The extreme difficulty of purification, the great oxidability, the extreme hardness, and the slender affinity for either copper or zinc, of manganese, render it very unlikely to produce a German silver of a tractable and durable character, even if unexceptionable in point of color and lustre. The experiments made by Messrs. Montefiore, Levi & Co., of Liege, for the Russian Government, upon the introduction of manganese into bronze and phosphor bronze for cannon, quite sustain our anticipations of failure—though we by no means wish to discourage an exhaustive trial, which could not but be undeniably valuable at least. But meanwhile though the sources of nickel are restricted, they are capable of great extension whence we have indicated and from elsewhere. To supplement largely the raw material is the true and obvious remedy either for a real scarcity of the metal or for an artificial one produced by aprocryphal statements or by monopoly.—*Engineer.*

MECHANICAL PROGRESS.

American Iron in England.

The only important advantage after a consideration of the coal qnestion, which England has over the United Statcs at the present timo in the prodnction and manufacture of iron, is cheap labor, and thie advantage is gradually disappearing nnder the continnal and successfnl efforts which are being made in that connlry to soenre a better price for lahor. This fact ie already patent to English iron masters and to capitalists there ingeucral. Indeed, we are already occasionally furnishing iron for English workers in that metal, as will be seen hy the following extract, from the Londou *Colliery Guardian*, which extract also shows what they think over there on this important matter.

"The present anomalons condition of the coal and iron trades of this conntry has received several striking illustrations during the last few months, but wo question if any more startling fact has been recorded than that mentioned in the letter of onr Wolverhampton correspondent, who has learnt, from a trnstworthy source, that an order for 1,000 tons of iron for consumption in England is in course of execntion in America, and will be delivered on onr shores at a lower prics than it can be bought for on the spot. It is also stated that axles are being sent over by American manufacturers and delivered in England at £3 per ton lower than the rate asked by home prodncers. This is a turning of the tables, indeed; ouly to he matched by the recent literal fnlfilment of the adage abont sendiug coals to Newcastle.

The causes of this anomaly are not diffienlt to ascertaiu. At the root of them all lies the simple question of labor. The pre-eminence of onr conntry as the workshop of the world was almost wholly due to the abundance, and conseqnent cheapness of labor. Onr rivals in new and undeveloped fields of indnstry felt this difficnlty to be almost insurmountable. This is sufficiently proved by the fact that onr American cousins, notwithstanding the hedge of "protection," thrown round their manufactures, have been outstripped in their own markot hy English prodncers. No hnman foresight ooald have predicted the strange revolntion which has taken place in the English labor market dnring the last two years. We have referred, time after time, to the mischief which conld not fail to result from the extravagant demands of the laboring classes, but sooner than we ooald have anticipated that mischief has become apparent.

The aspect of the iron trade, especially in the inland districts, presents something very much akin to stagnation, and it is clear that in a very short time, without some speedy and unlooked-for change takes place, the furnaces, mills, and forges must in many cases cease operations. The masters aver that, in the present condition and temper of the labor market, nothing can avert this serious collapse in trade. The matter rests, therefore, to a very large extent, with the men, or rather with those who have led them on to this situation of perplexity.

The qnestion is a most important one, and if great mischief is to be avoided, it will not admit of much frrther delay. It would be well if those who in defiance of all the simplest laws of political economy, have forced np labor to a purely fictitions value, would have the courage to confess their error, and employ their influence to modify the disastrous consequences which threaten commerce, and which their mistaken policy has mainly helped to briug about."

The labor question and the scarcity and high price of coal, however, are not the only things which are tending to transfer to this coutiuent the workshops of the world. The inventive genins of onr people is more earnest than the English in seeking out new devices to do away with hand-labor. Much of the work which in English shops is done by hand is done here by machinery, and at a greatly-reduced cost. The Englsh are not au inventive people to anything like the extent to which the Americans are. This fact is also fully acknowledged by our friends over the water; for the very article from which we have quoted so largely above contains the following sentence: "We, in this country, have relied too much on our cheap lahor supply, and have paid too little regard to the wonderful scientific progress in the provision of labor-saving machinery, which our transatlantio rivals have been makiug."

While we entertain no feelings of triumph at any success which the mechanics of this country may gain at the expense of our English friends, we nevertheless hold it a matter of dnty, as faithful chroniclers of "mechanical progress," to keep our readers iaformed of all such changes as they are brought to light.

THE Agricultural Society of Breslau, Germany, offers a prize of $700 in gold for the steam-plow apparatus which will work best at trials to be made on the farms near that city this summer.

The Future Supplies of the Superior Metals.

The nse of metals has grown so rapidly of late years that the qnestion is often seriously put, are we sure of adeqnate supplies? That can only be answered by a review of the source from whence we may expect to derive them. Copper, although it has risen in valne more rapidly than any other metal, in oonsequence of stocks being low, and becanse the price a short time ago was so poor as to stop numbers of mines, can be supplied *ad libitum*. The world is full of oopper. England and Wales are rich in the metal. Ireland abounds in it. There are good lodes of copper in the Peninsula. Ia the Himilays stones of oopper crop up. Australia possesses it in various dircctions. Bnt it is in the western hemisphere it is most abnndant. It lies almost iu every direction. Iu Canada, the United States, both east and west of the Rocky Mountaius; on the slopes of the Andes; iu Chili and Peru it appears in every form and in ovorwhelmiug quantities.

The supply eanuot fail at the present rate of consumption for thousands of years. Lately the price has gone down notwithstanding the new uses to which it has been pnt. In fact, the demand fell off, supplies iucreased, and stocks became so large as to weaken the market. Lead.—There exists no apprehension as to the supply of lead. The price has not advanced duriug the active years for the metal trade, 1871-72, at all in proportion to that of copper, tin, or iron, but it has advanced, and is likely to do so considerably in 1873.

There can be no lack of copper, for Cornwall, Shropshire, South Wales, Ireland, the Iberian Peniusula, Australia, and the United States of America, can produce all that will be wanted for ages to come. Black lead iu certain forms and black jack exist in Cumberland, Westmoreland, Derbyshire, Ireland, and in various countries abroad in quantities adeqnate to all possible demand for a time to come incalculable. The metals which are little nsed, or prodnced in the smallest quantities, such as platina, nickel, manganese, etc., are to be found in quantities sufficient for the demand in California, and especially in Colorado and Nevada.

Quicksilver is especially the product of Spain; much of what we import we export. The metal is also found on the Pacific slopes of the Rocky Mountains and Cordilleras. Tin—This is a metal more prized than it has ever before been, and than any other of the metals greatly in use except the precious metals. Cornwall and Devon had the mouopoly of its production from the days when the Phœnicians flocked to Marazian to exchange Tyrian cloths for it. The discovery of this metal in the Dntch settlements of the Straits added vastly to the supply, and it is now reported that in South Australia there is a considerable tin area, and in Queensland also; from the latter some freights have actually arrived. There is no prospect of its being too abundant, and although it has lately rapidly dropped in value, it is destined to bring a bigh price until some new and more extensive discoveries are made of it.—*Mining and Commercial Times.*

A New Cement—Pfundite.

There is a mineral found in Northampton County, Penn., which is made up as follows:

Silica	61.30
Alumina	21.55
Oxide of Iron	14.10
Lime	1 30
Magnesia	.63
Hygrometer moisture and loss	.82
	100.00

Mr. Anthony Pfund, of New York city, who has invented a method of utilizing this mineral, in the manufacture of hydraulic cement, has given to the mineral the uame of Pfundite.

By heating the mineral to a red heat, the silica is caused to combine with the oxide of iron, and with parts of the alkaline earths, and if this product is mixed with sulphate or carbonate of lime, tho mass is claimed to poseess the properties of a valuable hydraulic cement, becoming hard in a short time, and capable of resisting moisture.

Another compositiou of which the Pfundite is a base, is as follows:

The mineral is mixed with from three to four parts of carbonate of lime to one part of silica alumina, and oxide of iron and alkali. This mixture is formed into bricks which are burned at a read heat, and when cold, pulverized. The product is claimed to be a superior hydraulic cement.

Another composition is made as follows: The mineral is heated to a read heat, and then mixed in the following proportions: Pfnndite, one part, hydraulic lime, cement, or plaster of Paris, two parts; coal ashes, from five to six parts. This last, mixed with a sufficient quantity of water, is formed into bricks, or may be used for coating and fire-proofing walls.

Other mixtures may be made with various ingredients, and of various proportions, and it seems probable that the miuoral, which is tho principal ingredieut in all of them, will prove to be of high industrial value.

SCIENTIFIC PROGRESS.

Impurities in Lead.

Lead which is made in a blast furnace is always soft, dnctile, and flexible, bnt has only slight tenacity. A freshly cnt snrface has a bright lustre, which soon disappears. It soils the hands, papor and linen goods. It can he rolled without teariug; when melted has a white color, and beantifully smooth surface; by higher oxidation shows a play of colors which, however, differ but little from those on impure lead. Pure lead shows slight oryst dline strnctnre, and, on the whole, the surfaoe has an evenly fused appearance; if crystalization appears on the surface it is due to unequal solidification. Snch lead, when heated almost to its melting point, shows, ou breaking, a colnmnar fractnre. A white color on the surface and on the fracture are special signs of impure lead. Many poor sorts of lead are perfectly white from impurities, but then the color is due to silver rather than tin. The harduess of lead is due principally to the presence of sulphur, antimony, and arsenic. These impurities diminish its dnctility and mslleability; bnt snch lead will offer greater resistance to compression. Contamination with a small quantity of the oxide of lead, mechanically mixed, is an advantage if it has to bear a strain. If, on the contrary, ductility is reqnired, as for sheet lead and foil, oxidation must be avoided as far as possible when fusing. Copper has no influence on its hardness, bnt if iron and copper combined with sulphur are present, the lead is hard. The sulphur compounds melted at a higher temperatnre hardon the lead; at a lower temperature this is not the case. When melted at a low temperature, the sulphurets of the metals collect on the surface, snd such lead, when used for making white lead, shows irregular dark shades.

Lead takes up one per cent. of zinc, and less than one per cent. of iron; the amount of copper taken up increases as the temperature. If it does eot contain over one to one and a half per cent. of antimony, it may be smelted in a reverberatory furnace, air heing admitted. The pure lead separates and flows out, while the snlphides of the metals remain, even when they are oxodized by the use of nitre, and separated in this way. If more antimony is present, which is the case with Spanish lead, the oxidation is prolonged, and a hard lead is obtained, while the slag contains much antimony.

As yet no successful method or process has been devised for perfectly separating antimony and lead. Even refined lead contains always very small quantities of sulphur, iron, tin, and antimony, and a somewhat larger qnantity of copper. If it is entirely free from tin and antimony it exhibits, when fluid, a splendid play of colors. Pure lead is recognized by a fine scum, which covers it when fused, but which tears on moving the surfaoe. Soft lead breaks with a fibrous fracture, and the surface is coated with beautiful red and blue colors. If the lead contains zinc, or zinc aud antimouy, it appears of a beautiful white; tin and zinc are less common, but antimouy, usually in combination with sulphur, gives to blast-furnace lead its peculiar white color and hardness. Since sulphur compounds of copper, antimony, iron, and arsenic are melted into lead at higher temperatnres, it must first be purified from these as far as possible before any further use is made of it.

As regards impurities in lead that has been purified, there is always a trace of iron present, also antimony, which is, however, combined with very small qnantities of silver. If the copper is to be all or very nearly all removed, a number of successive smeltings is necessary. The higher the temperatnre, the more oopper can be taken up, about one and a half to two per cent.; if considerable sulpher is present, the oper combines with it, and may be more easily removed, because almost the last traces of sulphide of copper rise to the surfrce and can be ekimmed off. Lead purified thus contains but 0.1 to 0.2 per cent. of copper.

For many technical uses it is not necessary to have the lead so perfectly pure, but for glass, and in making white lead, small impurities are injurious, which are much less so in sheet lead or lead pipe. If lead used in making white lead contains much copper, it gives a faint reddish shade. This red color disappears entirely, if a sufficient quantity of the gasses are admitted during its manufacture, and scarcely appears at all, if there is a stronger current of air, and the red color is more perceptible in the iuterior of the white lead. When sulphide of antimony is present, the red is no longer perceptible. Pure lead melts at 625° to 635° Fah., and solidifies quietly with depressed surface. Heated almost to fnsion, it becomes brittle, and breaks in pieces under the hammer. At a white hoat, iu the absence of air, it boils and begins to give off vapor.—*G. Brigel in Berlin Chem. Soc. Proc.*

SOLUBLE GLASS.—The employment of soluble glass in the chemical and industrial arts is constantly increasing, and its value is now fully established. Recently a cement of great harduess and various applicability has been produced by mixing defferent bases with this singular substance. It is found that, combined with fine chalk and thoroughly stirred, it will produce a hard cement in the course of six or eight hours. With fiue sulphate of antimony, a black mass is produced which can be polished with agate, and possesses a superb metallic lustre. Fiue iron dust gives a gray black cement. Zinc dnst prodnces a grry mass exceedingly hard, with a brilliant metallio lnstre, so that broken or defeotive zinc oastings can be mended and restored.

Cause of the Decomposition of Eggs.

The question of the decomposition and decay of eggs has been the object of numerons experiments, some of which seemed to lead to opposite oonclusions. A committee of the French Academy have arrived at the following conclusions:

1. Eggs that have not been shaken can be preserved quietly without fermenting or decaying.

2. Shaken and broken eggs decompose in less than a month.

3. In no stage of decay is the slightest traco of an organism, either animal or vegetable, to he found in the egg.

The decomposition of eggs, with all signs of decay, and without the presence of any microscopic organisms, is contrary to Pasteur's theory, according to which every destruction of organic matter, and its conversion into its inorganic elements, is due to the development and increase of small organisms. U. Gayon has made some new experiments on this subject, the results of which are given in *Comptes Rendus*, vol. 76, p. 232.

By exposing unshaken eggs to the atmospherie air, at a mean temperature of 77° F., he found that one portion of the egg underwent decay, the other did not.

On making the same experiment with shaken and broken eggs, some decayed, others did not, even for several months.

In all csses where the eggs remained sonnd it is impossible to discover the slightest trace of an organism; on the contrary, in all those which decayed there were numerons microscopic organisms from the species of vibrones and mushrooms.

These facts contradict the previous supposition. Without anticipating any decision which may be obtained by further experiment, Gayon inolines to the opinion that the germs of organisms are originally present in those eggs which decay.

NEW HORTICULTURAL FERTILIZER.—Some time since we called attention to a new chemical fertilizer for horticultural purposes, suggested by Dr. Jeannel of Paris. *Les Mondes* of recent date, in commenting on results obtained by its use, says that it represents the fertilizing principles of at least one hundred times its weight of concentrated animal manure, and supplies to the plants nitrogen, phosphorus, potash, sulphur, and iron in a completely soluble state. The compound consists of 400 parts of nitrate of ammonia; 200 parts biphosphate of ammonia; 250 parts nitrate of potash; 50 parts muriate of ammonia; 60 parts sulphate of lime, and 40 parts sulphate of iron. These ingredients are pulverized and mixed. One dram of the powder (about a teaspoonful is then dissolved in a quart of water and a wineglassful of the solution given two or three times a week, in accordance with the health and luxnriance of the vegetation.

The plants may be placed in any kind of earth, however poor, eveu pure sand, or may not be potted at all. It is stated that certain flowers, the fuchsia, for example, may be cultivated without earth by simply placing the stalk in a jar, at the bottom of which is an inch or so of water, just sufficient to cover the ends of the roots. To the fluid a proportional qusntity of the fertilizer is added, as above specified, once in eight days. The foliaceous development of plants treated with the substance is said to be truly wonderful, and yet the rapid growth of the leaves does not interfere with tho most luxuriant flowering. To this we may add that quite recently we have tried a compound hastily oomposed of the majority of tho substances above detailed, merely as an experiment, on a small and sickly fuchsia. The plant was drooping and little else remained than a half dry stalk. After two applications of the fertilizer, its effect was apparent, and at the end of ten days, duriug which probably half a pint of solution had been supplied to the earth, new shoots had sprung out, leaves formed, and the entire plant became perfectly loaded down with buds.

HOW DELTAS ARE FORMED.—It appears from the observations of Mr. David Robertson, F. G. S., that iu fresh water particles of clay were held suspended for a long time before wholly subsiding, while salt water, or a mixture of salt and fresh, became comparatively clear in the course of a few hours. The results showed that water only slightly brackish had a great power in precipitating the clay, and from this he conoluded that the great bulk of the clay carried down in solution by rivers must be deposited before it could reach any great distance from the seashore. This may throw some light on the formation of deltas, and on the silting up of the river courses within the influenoe of the tides. It may also assist iu determining how far the glacial mud, for example, could be carried into the seas by tides and currents.

RENEWAL OF THE REWARD OF ONE HUNDRED THOUSAND DOLLARS.—The Legislature of the State of New York has recently renewed, for the period of one year, the offer of one hundred thousand dollars reward for improvemente in canal navigation. This will be good news to scores of inventors.

☞ IN EVERY FRIDAY'S ISSUE of the DAILY MINING PRESS we publish, in connection with this table, the highest and lowest rates of sales during each of the past twelve months.

ASSESSMENTS, MEETINGS, DIVIDENDS.

A Shareholders' Directory—Compiled Daily for the Mining Press.

NOTE.—In the Stock Boards an assessment is delinquent thirty days from the date of levy, exclusive of that date. The delinquent dates given in this list are those of the mining offices.

ASSESSMENTS.—Stocks on the Lists of the Boards.

Our Weekly Stock Review.

THURSDAY EVE, July 10, 1873.

The members of the Stock Board having been taking a holiday, the Board did nol convene unlll Tuesday last. Contrary to general expectations, the market was dull, stale and unprofitable. Little business has been done during the week and prices bave been low. There is little news of interest from the mines. The Belcher has declared a dividend of $8 per share, amounting to $432,000 payable to-day. Last month it paid $10 per share, or $1,040,000. Crown Potat pays this month only $4 or $400,000, whereas last month it declared as dividends $1,000,000. The reason for the fall was breakage of machinery and other unlooked for mishaps which naturally decreased the ore production. Meadow Valley pays its usual $1 per share or $60,000. Eureka, (Grass Valley) pays $t per share, aggregating $20,000. The Raymond & Ely mine has again passed its dividend. Underground work in the mine has been suspended for the present until the extensive surface repairs and alterations in contemplation and under way are completed. An immense amount of machinery for the mine is on the way there. The Crown Point carries over to next month's account $400,000.

The Comstocks this week have been very dull, little business being done in them, and prices declining. On Wednesday the whole list broke down, and at close Belcher was $1.50 lower; Balt. Con., $1; Chollar, $5; Gould & Curry, $1; Hale & Norcross, $5; Ophir, $4; Overman, $5; Savage, $30; Seg. Belcher, $8; Jacket, $4. The decline in Savage was the feature of the day.

To-day the market looked up a little, and prices advanced to some extent. The fluctuations, however, were slight.

The following items of interest from prominent mines are collated from letters or telegrams from superintendents on file at the offices of the respective companies in this city.

Belcher.

Dispatch of the 8th says south crosscut, 1200-foot level (305 feet south of the line) shows some ore in face. No change in 1300-foot level crosscut. South face, sill floor, improves. South drift in fine ore. General progress of mine very fine. Car samples, $82.

Dispatch of the 9th says the south crosscut, 1200-foot level, shows some splendid ore. The crosscut on the 1300-foot evel remains unchanged. South drift, 1300-foot level, still in splendid ore. Assay $78 per ton.

Buckeye.

Letter af the 7th says have na change to report from company's mine. Shipped to-day one bar of bullion valued at $1,196.88. Ore clipe for the 3d 16 tons 650 pounds.

Crown Point.

Dispatch of the 8th says that on the 1400-foot level crosscut they have about two-thirds as much water as they can handle. Winzo of the 1200-foot level is in fias ore, and if the first wall keeps its present course it will be about thirty feet yet to the east wall. In the crosscut from the sill floor they started a winze from the 1300-foot level on the east wall and about 275 feet in a direct line north of the Belcher. The winze is down four feet, is $100 ore. No change elsewhere.

Dispatch of the 9th says we have three drill holes in face of 1400-foot level crosscut, 17 feet deep, and also another in 13 feet. Will run it 20 feet in if necessary. Think this hole will give us all the water we can pump. Have made no progress in sill floor crosscut, 1300-foot level, since last report. No change elsewhere.

Chollar-Potosi.

Letter of the 8th says during the twenty-four hours ending morning, 123 tons of ore were taken from the mine, and and 60 tons, 100 pounds forwarded to mill. Work at all points of the mine is fully resumed. Water supply as pumped from the shaft is adequate for steam making purposes, also for fire, should any occur. East crosscut on fourth station, has some quartz showing some metal. Nothing important at this writing.

Caledonia.

Letter of the 8th says the face of the main drift at the second station is now exceedingly hard blasting rock. Has touched the south drift. There is nothing new to report, the ground still continuing tough, and the work is of course slow.

Equitable Tunnel.

Letter of the 4th says there ie no special change in the appearance of the rock in this tuanel, streaks still continue, and the rock looks as favorable for ore still as at any time since work was commenced, and we feel confident, from indications, that we are in the vicinity of ore. The appearance of the rock ie precisely the same as it was before the vein was struck. Work will be got on more rapidly the coming week, as no one was working this week. It will be run night and day in this until contract is finished.

Gould & Curry.

Letter of the 8th says the pumps are rapidly reducing the water, accumulated during the stoppage, on the 1600-foot level. The air gallery connected with the Savage mine is nearly timbered. The passage of air currents through this connection is rapidly reducing the temperature of the various parts of the mine. From this point we have started a crosscut to the east at a point 100 feet distant from the southern boundary. On the tenth, or 1500-foot level, we are still advancing with the northeast drift, on hard material. On the second level we are extracting a few tons of ore of a paying quality daily.

Lady Esten Tunnel.

Letter of the 4th inst. says the contract closed on the tunnel on the 3d. The entire length of the tunnel is 360 feet. From hroast to surface, 155 feet. The rock for the last twenty feet has not been very encouraging, rather barren, not mineral rock. A change is evidently taking place, spar and lime coming in on the right, and looks decidedly more favorable. The air pipes will have to be put in before the tunnel is driven any farther. Have concluded to start a drift on the vein of pyrites of iron and peacock copper, and test it, but shall not go far unless it improves.

Ohio Con. G. M. Co.

Letter from the Superintendent under date of the 7th says that the chimney in south drift has been proved for 18 feet in length thus far, it has narrowed down, but indications are that it will soon widen again, the chimney has only been worked for 60 feet in depth, from the top in old works, which leaves a body of ore of 100 feet overhead to stope out, which will mill $50 per ton. The cross drift to the east vein still continues very hard; only able to make one foot in 24 hours it is expected, however, that the lode will be reached during the present week. The second clean-up from the mill will be made by Monday, which will give the result of 100 tons in full.

Page & Panaca.

The work is progressing favorably and as fast as possible with no new developements.

Mining Summary.

THE following is mostly condensed from Journals published in the interior,in proximity to the mines mentioned.

California.

AMADOR COUNTY.

OTIS MINE.—Amador *Dispatch*, July 5: We were shown a very rich piece of quartz which had just been taken out of this mine near this place, now being prospected by Mr. Pierre David. The piece would probably weigh about 75 or 80 pounds, and was literally studded with sulphurets, interspersed with numerous particles of free gold.

CALAVERAS COUNTY.

OHIO CONSOLIDATED.—This mine, located one mile east of West Point, shows tangible symptoms of a valuable mine. The property consists of two parallel veins some 100 ft. apart. The main shaft, on the west vein, is 160 feet in depth, at the bottom of which, levels are being run north and south. A transverse drift is also driving towards the east vein which the Superintendent expects to tap in a few days. About 50 tons of ore were crushed at Harris' mill, which yielded over $25 per ton. The mill is running again on similar ore from the same stope. Judicious management of the mine gained a victory in spite of adverse circumstances, and the present Superintendent should receive the praise he has merited.

DURYEA HYDRAULIC CLAIM. — Calaveras *Chronicle*, June 5: Work is being pressed forward energetically in the mine with the most satisfactory results. Acres upon acres of the ridge—the gravel being over 100 ft. deep, having been washed away, and still scarcely a commencement has been made towards working out the claim. 300 inches of water are constantly used, and the mine is fully supplied with all the modern appliances for working to advantage. A monster derrick has recently been erected for removing the cement lately uncovered, and the machinery works as well as could be wished. The mast is sixty feet in height and the boom fifty feet in length, both being massive timbers capable of sustaining almost any weight. The derrick is operated by means of two hurdy-gurdy water wheels, on the same shaft so constructed as to permit of reversible action. The derrick greatly facilitates operations by removing the rocks from the mine rapidly and with but little expense, allowing the hydraullo unobstructed play upon the bank of gravel. A short time since a blast, composed of 14 kegs of powder, was exploded under a point of the bank that was so hard as to be "piped" with difficulty. Two tunnels were run in a considerable distance and transverse drifts dug accross their inner extremities in which the powder was placed. This blast did good execution, shattering the bank and loosening the gravel for a considerable distance. The Duryea claim is the most extensive and profitable in the county.

BREWN & COOGINS have run an incline 200 ft. in length, to the bottom of the tunnel. The claim is on the famous Tunnel ridge lead, which has paid continuously for miles. The channel has but recently been reached and the work of getting the claim in shape for profitable working is just completed. The gravel taken out pays handsomely, and we feel certain that the mine will shortly rank among the first in the district. The gravel is brought up "out of the depths" in cars drawn by mules.

BRACKETT & CO.—This mine is an old one, from which thousands of dollars have been extracted, but a new tunnel has lately been run for the purpose of tapping the channel higher up the ridge. The tunnel is 400 ft. in length, the greater portion of the distance through solid bedrock, straight as an arrow and one of the handsomest pieces of work of the kind we ever saw. The channel is just reached and the gravel looks excellently well. No washing has yet been done but the claim is known to be a good one beyond a peradventure. A battery is to be erected, for the purpose of crushing the gravel, as soon as the new diggings are fairly opened.

SIMPSON, VEITH & SHEAR.—This is one of the most extensive and promising claims in the county; 300 inches of water, with a pressure of 200 ft., are brought to the mine in a 11-inch iron pipe and projected against the bank with prodigious force. The claim is one of the best fitted-up of any we ever saw. The appliances connected with it being first-class. The company own a large area of ground, and the washing, so far, has paid beyond the most sanguine expectations. The bank is about 80 ft. in height, and contains gold from the bed-rock to grass roots.

MOZER & HOWARTH.—The work that has been accomplished by these gentlemen is truly surprising. When they commenced operations, about two years since, the entire gulch was filled with tailings from the mines in the ridges on either side, to the height of from 40 to 75 ft. The debris has been washed away down to the bed-rock, for a considerable distance, thousands of inches of water being at times employed in the work. The water was collected in reservoirs at the head of the gulch, and when filled the flood-gates were hoisted, the deluge sweeping the tailings with irresistible force down the ravine. The gold settled to the bottom of the gulch, and now the auriferous gravel is being shoveled into sluices. We learn that the claim is paying splendidly. From six pans of gravel $300 were obtained. A clean-up is to be made shortly, when we look for a larger yield, in proportion to the quantity of gravel washed, than ever obtained in this vicinity.

NEVADA COUNTY.

MANZANITA CLAIMS.—*Transcript*, July 1: The Manzanita Mining Co. made their first clean up for the season yesterday. The result was 641 ounces of gold, and the yield has been excellent. There is yet a large amount of work to do fitting up the new and lower tunnel, which it is expected will be ready for mining by the beginning of next season. The new tunnel is much lower than the present working point, and will enable the company to work to better advantage.

RICH STRIKE.—Novada "Transcript," July 2. The Gold Run Mining Company, on Gold Flat, have made a rich strike. A few days ago they cut the ledge, which is a foot and a half thick, and it is estimated the rock will pay from $60 to $80 per ton. In a day or two they will commence drifting on the ledge from the old works, which were lost some years ago. Having struck the rich shute they will soon be getting out good pay. The prospect of this Co. is highly encouraging.

CEDAR QUARTZ MINE.—Placer *Herald*, July 5: Owned by Mr. James Nickerson, located on Wolf Creek, about two miles north of Gautier's Toll House, on Bear River, is proving to be one of the most important in the State. The ledge is some 30 ft. in width; is full of sulphurets, which yield gold, silver and copper. Its course is northeasterly and southwesterly, the entire length of which is 4,600 ft., following along and through the bed of Wolf Creek for 1,400 ft., at which point an abrupt turn of the creek is made, and the ledge pursues its course through a high and precipitous bluff, but showing its croppings the remainder of the distance. Two shafts are sunk at the foot of the bluff, and a tunnel 130 ft. in length, at a depth of 40 ft., is drifted along the course of the ledge. The rock is looking well and shows minute specks of free gold. Samuel Bethell, U. S. Deputy Mineral Surveyor, has just completed the final survey for patent, and likewise made surveys for a water ditch. He finds that at a distance of one-half mile from mill site a fall of 40 ft. can be obtained on Wolf Creek and an excellent point for a dam secured, together with plenty of free water, thus securing force to drive a 40-ft. over-shot wheel at comparatively small expense. A gang of men (some Chinese) are grading a road from the old Grass Valley Toll Road, a distance of some 2 miles, to the mine. A new dwelling-house, boarding-house, blacksmith-shop, stabling, etc., are nearly completed, and appearances indicate that work in earnest is commenced, and a full development of this promising mine will be made. Judge Goodwin, late of Nevada, has recently purchased an interest of Mr. Nickerson.

CHERRY CREEK.—White Pine *News*, June 28: George W. Doane has returned from a trip to Cherry Creek and vicinity, and has exhibited some specimens found by him in that locality. We have no hesitation in pronouncing such rock as we saw, the richest that any section ever produced, and its similarity in general appearance to that found in the Comstock, leads us to the belief that a rich camp has been discovered. The presence of particles of pure gold and silver, in different varieties of rock, proves its richness, and the quart formation in which it is embedded, adds additional proof as to its extent and permanent veins. He says that as great many miners, prospectors and speculators are daily making their appearance in the new camp, and all express unbounded faith in its future.

TUOLUMNE COUNTY.

THE EXCELSIOR.—Tuolumne *Independent*, July 5: Last week cleaned up out of 20 tons of ore, 62½ ounces melted gold—which will net about $1,200.

Water has failed at the Spring Gulch Mine, and the chances for more ars slim until the rains set in.

The miners at Cherokee have plenty of water since the farmers in the hills have stopped irrigating their clover.

Funck & Co., Cherokee, from a run of eight days, (crushing 40 tons of rock in their five stamp mill,) brought into camp, on Monday, 54 ounces of gold.

CORDOVA.—The prospects in this mine are good. Frank Prudhomme, the owner, has sunk an air shaft from the top to the tunnel. Will probably crush a small batch of rock next week.

NEW MILL.—The Golden Gate Quartz Co. have contracted for a new ten stamp mill. The Seeber Bros. have the contract for building, Bradford & Way; the lumber; and Phelps, Shepard & Cowie, of the Sonora Foundry, the machinery. Excavation for a foundation has already been commenced.

The claim just north of Capt. Eskin's, at Columbia, still holds good, and is paying $5 per day to the hand, although worked in the primitive manner peculiar to Chinamen. The place was formerly the garden of John Alexander, who sold the ground to the Chinamen for $550. They have already taken out several thousands of dollars, and to-day the mine is worth hundreds more than was originally paid for it.

RICH CLAIM. — Some very rich dirt is now being taken out of Capt. Eskin's claim, in the old reservoir, Columbia. Several pieces of from 75c. to $1 have been picked out of the bank of earth they are washing, and the prospects are that the pay-gravel will run deep. A company of Chinamen are very anxious to purchase the claim, and have offered $4,000; but the Captain's price is $6,000, exclusive of the pipe and flume. The probability is that the Celestials will finally raise the cash and close the bargain, as they are now in correspondence with parties below.

PATTERSON MILL AND MINE.—After three weeks' run with his new twenty-stamp mill, Mr. Hughes has cleaned-up. The result is most gratifying. It has exceeded the most sanguine expectations. The rock crushed was not selected, and the gold bricks produced are convincing proof that this mine and mill will take a high rank among the gold-producing institutions of the county. The sulphurets, which yield a large assay, are collected in large tanks, and Mr. Hughes intends to erect apparatus to work them, and thus add to the magnificent returns which he is already receiving.

WONDER.—Quartz vein, on Fox Gulch, west of Columbia, owned by D. H. Crocker & Co., is proving true to its name. The rock prospects splendidly, showing free gold in every piece, and the casing is also exceedingly rich. The vein, including casing, is 2½ ft. wide, and in the tunnel just started gives every indication of increasing. Mr. Knight, an expert from below, visited the mine on Friday of last week, and expressed himself well satisfied with the prospect.

GOOD ROCK.—Twenty-eight tons of rock taken from the Horse Thief mine near Jesus Maria, lately paid $700 — an average of $25 per ton. The quartz was crushed in the arastra connected with the mine. We learn that the lead is developing well and that the prospects of the mine are very flattering.

Nevada.

BRISTOL.

HERCULES.—Work during the week has been principally of a nature preparatory to operations on a larger scale than heretofore.

SULTAN.—The ledge has widened in sinking during the past week, and is now fully 10 ft. wide, showing throughout its width ore of fully as good an average quality as previously.

ELY.

ALPS.—Pioche *Record*, June 29: Work is being rapidly prosecuted on the lower drift from the main shaft, which is now in about 250 ft. It is expected the ledge will be struck at about the distance of 280 ft. From the stopes and drifts on the 164-ft. level the same quality of ore is being extracted. About two tons of first-class ore is being raised daily.

PEAVINE.—No material change to note. The ore throughout the mine is fully equal in quality and quantity to the developments of the past few weeks.

RAYMOND AND ELY.—Underground work has been suspended for the time being, until the extensive surface repairs and alterations in contemplation and under way are completed. An immense amount of new machinery for this mine is now en route from Palisade to this place.

SOUTH SIDE.—This location—a home incorporation—is situated just above the crest of the mountain, some 450 ft. beyond the water tank. The shaft was started in hard blue limestone, and has now attained a depth of 100 ft. At about 75 ft. the character of the limestone changed, and is heavily stained with mineral.

AMERICAN FLAG.—Shifting the main shaft, and crowding the work with all possible dispatch. Shipping ore constantly to the mill, which is running on full time.

PACIFIC TUNNEL.—A contract of 100 ft. has just been completed, making the extreme length of the tunnel 1263 ft. A new contract for from 100 to 200 ft. will be let to-morrow. Indications of the close proximity of a main ledge are unmistakable. For some distance past, bunches of ore have been cut in the tunnel, some of which assayed very high.

HAVANA.—Shaft 320 ft. deep; vein 9 ft. wide; all ore. About 10 inches from the foot-wall is a streak of ore 30 inches thick and of extraordinary richness.

EXCELSIOR.—Still drifting from the new shaft at a depth of 180 ft. to make the connection with the old workings. As soon as this is accomplished, ore will again begin to come to the surface.

BOWERY.—A great change for the better is noticeable in this mine. Everywhere throughout the stopes an improvement is visible. There are now about 50 tons of magnificent ore on the dump, equal if not superior to the rich ores that made the name of the Bowery famous in the past history of Ely District. Expect to commence crushing again on the 1st proximo, or as shortly thereafter as the mill can work for them.

PIOCHE.—Working the usual number of hands and raising about five tons of ore per day. Expect to resume crushing on or about the first of July.

CHIEF OF THE HILL.—Have completed the raise from the 150-ft. level, Wright's shaft, and drifted 20 feet from the top of the raise, the drift showing a little ore all the way. The Wright shaft is now thoroughly timbered from top to bottom for the distance of 210 feet below the level of the tunnel, and sinking is now going on night and day. Taking out ore all the time; 40 tons on the dump. The stopes appear to be improving as they are raised upon.

SILVER PEAK.—The grading is completed for the reception of the machinery now on the way. This machinery, consisting of one 8x16 engine, with all the modern appliances and improvements that can make the works a success, has been heard from en route, and may be expected to arrive about the 2d proximo. The incline is being put in thorough order, and is being solidly timbered—preparatory to permanent and extensive work. Pending these changes, however, the raising of ore, is, for the time being, necessarily suspended.

ORIGINAL DEXTER.—Drifting both ways from bottom of incline. Plenty of good ore in sight.

MEADOW VALLEY.—Pioche *Record*, July 5: No change to note. Shipped $150,000 this month.

MAZEPPA.—The hoisting works have been completed; steam was raised on Monday the 23d, and sinking the main shaft resumed.

ORIGINAL DEXTER.—Pioche *Record*, July 6: Still running drifts in ore. In the south drift the vein is fully 3 ft. wide, and in the drift to the north it is over 4 ft. There are about 60 tons of rock on the dump—some of it very high grade. We recognized considerable ore that was the exact counterpart of the rich, dark-colored ore that first gave the Alps mine the prominence it has since so well maintained.

PIOCHE PHENIX.—Mr. Nelson has recently been appointed Superintendent of this mine, vice Captain Hardy, resigned, and work, which for a long time was suspended, has been resumed.

CHAPMAN MILL AND MINING CO.—Running a drift for the ledge from the 420 ft. level with favorable indications. The rock in the face is now deeply stained with mineral, and in all probability it will not be long before the ledge is reached.

LOUISE.—Drifting on a narrow seam of ore, cut last week in the 200-ft. level. The ore is a rich chloride, assays going over $200 to the ton. It is believed that this will lead to a large body of ore.

VULTURE.—Shaft between 85 and 90 ft. deep. More ore is coming in, and the general prospect may be said to be exceedingly good.

CAROLINE. — Captain Hardy, Superintendent of this mine, goes to the Bay in a few days, to be absent about two weeks, and on his return work will be resumed on a larger scale.

ALPS.—The face of the drift running from the ledge at the lowest level is now in hard white quartzite, and expect to strike the ledge very shortly. Elsewhere no important change to record.

PIOCHE.—Working the same number of hands as last week, and extracting about the same daily average of ore.

SILVER PEAK.—The machinery for the new hoisting works is now on the ground, and will be put in position with all possible dispatch.

EXCELSIOR.—Nothing new to note. Drifting from the new shaft continues.

LA PAZ.—Sinking the winze on the ledge and taking out some excellent ore.

PEAVINE.—Working full force, and piling up good ore on the dump.

SPRING MOUNT.—Pioche *Record*, July 6: This Co. is sinking to strike the Spring Mount lode, which is undoubtedly identical with the famous Burke ledge. In the upper works they struck 3 very large and well-defined ledges, but the ore was not considered rich enough to pay for working at present. The main shaft is down 350 ft., and is being driven night and day with three shifts of hands.

SOUTH SIDE.—Sinking the shaft, and averaging one foot to the shift.

PORTLAND.—Working the usual number of men and raising ore all the time.

BOWERY.—The rich ore noticed in our last still continues, with good promise for the future.

RAYMOND AND ELY.—As noticed in our last Review, underground work has been suspended for a while, pending the erection of the new hoisting works. Part of the machinery arrived during the week.

MEADOW VALLEY.—No ore is being raised at present through the shafts on No. 7 and No. 5—everything coming through the No. 3 shaft—though in point of fact it hardly deserves the name, when taken in connection with such a mine as the Meadow Valley, being small and crooked. In size it is only 5x3 feet, and of this only two feet nine inches is devoted to the bucket, which is necessarily small in order to raise the requisite amount of ore to the surface to run the mill. The lack of carrying capacity has to be made up by a speed of 800 feet a minute. The wear and tear is tremendous, so that the same kind of rope that was formerly used three months, now outy lasts 24, or at most 28 days. As soon as a connection is made with No. 5, where are the main hoisting works of the company, everything above and including the 7th level, will be worked through that shaft. This connection will certainly be made by the 1st proximo, by which time it is expected that the new works on No. 3 will be completed. The new engine has a 12 inch cylinder, and is rated at 40-horse power. It was made at the Risdon Iron Works, San Francisco. Thirty-six tons of ore are now being raised daily, notwithstanding the difficulties to which we have alluded, and it is certainly fully as rich as any we have ever seen from the mine. The bullion shipment for June was in the neighborhood of $135,000.

HIGHLAND.—HAMBURGH.—The vein in the shaft is gradually widening and is now a good three feet. On Thursday last, in the bottom of the shaft there was struck a narrow streak of a white and blue decomposed ore that assayed $350 to the ton. They will commence crushing ore from the Hamburgh at the Mendha mill about the first of August.

GEORGIA.—Driving ahead on the tunnel Ledge looks well.

MENDHA MINE AND MILL.—The mine looks well throughout and the mill is running steadily on its ores, with very satisfactory results.

OTHELLO.—Tunnel in on the ledge 60 ft., and shaft sunk at the end of the tunnel on the ledge about 12 ft. The vein is from 2 to 4 ft. wide, mostly galena ore, carrying a high percentage of silver. An average of thirty assays made by Mr. John Cahill gave a little over $180 to the ton. Notwithstanding the presence of galena, the mass of ore has been found to be of a good milling quality. Work on this mine, which has been for some time suspended, will be resumed next week.

CHIEF OF THE HILL.—In the drift at the head of the raise from the 150 ft. level from the Wright shaft, have made 23 ft. during the past week, and expect to make the connection with the works of the Chief East, in about a week more—sinking all the time. Working the usual number of hands, and taking out ore steadily. About 50 tons of ore on the dump. Mr. Cook, the foreman, showed us a specimen that to our minds cannnot be beat in the camp. We have seen all the beautiful specimens in the show windows and cabinets in town, but nothing finer than this; and what makes it more gratifying is the fact that there is plenty of it.

WASHOE.

UTAH.—Gold Hill *News*, July 5: Sinking in the new shaft of the Utah mine will be resumed on Monday next.

JULIA.—In the Julia the east drift at the 800-ft. level is being driven ahead, and at the 1000-ft. level the south drift is running alongside the ledge.

SENATOR.—The shaft of the Senator is down 375 ft., in the same encouraging character of vein matter as last reported.

MINT.—The upper tunnel of the Mint is in 150 ft., with two crosscuts into the ledge, showing very favorable-looking ore, and the Jacob Little has developed a good body of ore in the second crosscut.

IMPERIAL.—The Imperial turns out about 80 tons daily from the lower levels. Drifting both north and south at the 1400 and 1500-ft levels of the Yellow Jacket develops only excellent indications as yet.

CROWN POINT.—The Crown Point machinery is running all right, and the daily yield of the mine has increased to over 400 tons. In crosscutting for the ore vein, at the 1400-ft. level, the drill is kept running in ahead as a precautionary measure, guarding against a great rush of water.

BELCHER.—The Belcher is yielding over 500 tons per day. The 1300-ft. level continues to show improvement and the face of the main drift south is all in first-class ore. The main incline is now down below the

(Continued on Page 28.)

Largest Grape-Vine in the World.

California is noted for its "big things" the world over, and "we to the manor born" have, in oonssquencs, to be more careful in our assertions than those of other climss. But sven while ths average Californian feels not the slightest prickings of conscience when recounting the bsauties of his Goldsn State, people who have never crossed the continent are apt to maks some allowance for the sxaggeration which custom has long psrmitted travelers to indulge in. We have the largsst mines, ths largest valleys, the largsst farms—but why recount the many natural peculiarities of our thrice-fevored clime, which are so well known to all of us on the shores of the Pacific, though but half believed in away from the sound of its waters? One thing, however—the pride of the "lower country" has so obtruded itself upon publio notics, that its claims to notoriety are universally conceded. Ws refer to ths Santa Barbara Grape-vine, a rspresentation of which is given on this page.

Most natural curiositiss and localities of note have connected with them some little bit of romance, which lends an additional charm to the quist of a ruined church or towsr, and softens the ruggsd weather-beatsn sides of rocky heights, or lightens up a gloomy chasm as sparkling forth do the dark watsrs of a mountain stream. So it ie with this California wonder. We are told—no matter by whom; euch thinge should not be traced too rudsly—that a Spanish lady, when starting from Sonora on horssback, had given to hsr by her lovsr, a branch from a grape-vine, to be used as a riding-whip. She must have cherished this as a memento aside from its ussfulnese, for when she arrived at Santa Barbara, aftsr hsr long journey, she planted the branch, which has since grown into notoristy as the laigest graps-vine in the world. How long ago it was planted is somewhat uncsrtain. Some sey the Spanish lady came here bsfore the beginning of the present century. Others say the vine is 40 years old, and still othsrs say 48 years. Like many other things, evsn of rscsnt origin, the dates in connection with it are uncertain—though the grapes are not.

This famous vine is situated about thres miles and a half from the town of Senta Barbara, in the court-yard of an old adobe house. The trunk is fonr fest fonr inches in the largest part. It begins to branch out at about six or sight fest from ths ground, and is then supported on framework, which it covers as a roof, as shown in our illustration. The whols vine, supported on the framework, now covers over an acre of ground. Ssveral of ths limbs ars as much as tsn inches in circumference at a distancs of 25 or 30 feet from the trunk. Ths annual yield of grapes from this mammoth vine is from 10,000 to 12,000 pounds. The clusters of grapss average, whsn ripe, from two to two and a half pounds each. The vine is on rather high ground, and it is stated that the ground about it has never besn manursd at all. The soil under it is hard, and ths Spaniards dance undsr the shadow of the leaves of the vine, which form a completely sun-proof covering of living verdure. Thie vine by ite product eupported the old woman who owned it for many years. Another vine, near by, bids fair to rivel the "father of all vines," the fruit from it rather excelling that of the "big vine." A emall stream of water runs near both vines, which probably helps their growth.—*Ill. Press.*

THE SANTA BARBARA GRAPE-VINE.

Mixing Colors.—When different colore are mixed together, the reeult is not the destruction of any of the coloring elements, nor their chemical combination. The microscope ehows that the particlee of each of the colors entering into the mixture remain entirely separate and unchanged.

Fidelity, good-hnmor, and complacency of temper, outlive all the charms of a fine face, and make its decay invisible.

A Revolution in the Production of Butter.

Statemsnts havs been widely publishsd describing the msthod of manufacturing so-called butter from animal fat, as it has been carried on in Francs. The Nsw York *Sun* gives an account of what is now being done in New York. It is to bs presumed that thsre will be considerable room left for the old-fashioned kind of buttsr for soms time to coms, and at prices that will justify making. We copy as follows:

A company has bsen orgenized in this city, with a capital of $500,000, for the manufacture of butter. It is claimed that ths buttsr is genuins, the means of producing it being alone artificial; in other words, the discovsrsr affirms thet ths article is not merely butyrous, but in every respect the complete and psrfect thing, as agreeeble, nutritious, and usabls as the bsst Orange county butter. A gentleman of recognized ability as a chemist is the fortunate introducsr of this nsw wonder. Several persons of wealth havs bought stock, and in a week or two the manufacture will be conducted on a vsry large scale. The temporary offices of the Oleo-Margarine Manufacturing Co., as the corporation is called, ars at 40 Broadway, and their manufactory at Forty-fifth street. Arrangements have bsen made for securing better accommodations in Fiftieth strest, and very soon the markst will be fully supplied with the new product. At pressnt the demand for the article is so great that it is beyond the capacity of the company to supply it. The profits are expected to be over 100 per cent.

Fashionable Hotel Butter.

As this city-made Orange county bntter is need in many of the most fashionable hotels and restaurants, both for cooking and for ths table, it may be interesting to the readers of *The Sun* to lsern something of the method in which it is made. In the first place agents are employed to visit the slaughtsr houses and to buy up all the beef fat usually styled suet. This suet is carted to the buttsr factory and cleansed. Then it ie put into ordinary meat choppers and minced fine. It is afterward placed in a boiler with as mnch water in bulk as itself. A eteam pipe ie introduced among the particles of the suet and they are melted. The refuse or membrane goes to the bottom of the water, the oily substance floats and ie removed. Thie latter consiets of butter matter and etearine. A temperature of 80 degreee melte the former and leavee the stearine at the bottom. The butter metter, or cream, is drawn off; then about thirteen per cent. of freeh milk is added and the necessary salt, and the whole ie churned for ten or fifteen minutee. The reeult is Orange county butter at about one-half the ueual cost.

The stearine is sold at twelve cents a pound to the candle maker, and the refuse at seven cente a pound to the mannfacturer of food for cattle.

Butter for Summer Tourists.

All the leading eteamship lines between here and Europe are to be supplied this Summer with this newly invented butter. In taste and appearanes it is precisely similar to the finsst country butter, made from the milk of live cows. Several of the leading msn in the bntter trade have pnrchased stock, as have also many of the steamship linss and the proprietors of the lsading city hotsls. Prof. R. Ogden Doremus has testified to the success of the nsw method of butter manufacture, and prophesies great prosperity for the new corporation. Prof. Paraf, the discovsrsr, expects that the new product will drivs live cow buttsr out of the market altogether. The few unscientific outsiders who are acquainted with the facts now first made public, regard ths whole thing with amazement. It seems extrsmely odd to them that the same carcass which furnishes a fresh steak for breakfast should also supply the Orange county buttsr which they spread upon their accompanying hot rolls.

Admitting all that is stated in the foregoing to bs true, as rsgards ths process of manufacture and quality of the product, yet we fail to psrceivs the immsnse advantage claimed for the nsw process. To gst at ths "buttsr matter," as it is called, the animal must needs be killed; which ssems very much like "killing the goose that laid the goldsn eggs;" and yet the number of animals necessarily slaughtered for bsef, would undoubtsdly afford a considsrable supply.

All of this suet supply is not in the possss-sion of the new styls hutter mekers; they will have to buy their stock from the butchers; and how long would it be after it was known that these patent butter makers were making a profit of "100 per cent." ou cost of the suet, befors the butchers would put up the prics of ths same. So ws will rest easy, believing that California made buttsr, by the old process, will not wholly go out of fashion, in any event, not before we can dispose of our Stete's considerable stock of cows.

New Lake.—The Ventura *Signal* bas the following: Some distance up the San Buenaventura river, on the Saxby & Gilbert ranch, there is a beautiful little lake in the mountains, probably 500 feet above the sea, which hae been recently formed by the sliding down of an immense backbone of earth and rocks, entirely closing the place of egreee to the water, which, in the Winter comee ponring down the barancas and mountain sides. The lake affords a plentiful supply of fresh water for any number of cattle and sheep, and is clear and cool. The trees which stood in the bottom of the ravine are now almost lost sight of in the water, their dead tops only being visible above the surface.

The Colorado Desert.—A thorough and complete eurvey of the Colorado Desert, east of San Diego, with a view of ascertaining the practicability of turning the Colorado river into the Desert, and thus reclaiming vast tracts of land, is to be made by Mr. J. E. James. He is said to be backed by heavy capitalists.

Erroneous Wheat Estimate.

In our recsnt June 28th nnmber, we gave a tabular statemsnt copied from the Secramento *Record*, that now appears to us to be wrong somswhsrs. That statement put the total yield of whsat for 1872, at 12,701,000 csntels. Now the commercial records of ths port of San Francisco show, that ovsr 11,000,000 of centals of the crop of 1872 havs already besn shipped to foreign ports; whilst the quantity required for ssed and the year's consumption conld not have hesn less than 4,500,000 centals; which addsd to ths 500,000 centels of the old crop now on hand, would carry the yield of 1872 altogethsr above the *Record's* estimate of 12,701,000 centale as the total yisld. Will the *Record* set us right in the matter, and show us upon what it bases its estimate for an increased yield the prssent year over that of the last.

We think it a mistake of that portion of the press of ths State, which over-estimatss the probable yisld. It is doing the farmsrs an injury; for with every statement, up goee the prics of sacks one or two cents or more. As long as it was belisved that ths orops would be light, or less than last year, sacks were reasonably low; and the same condition also affects the price of frsights. The shipping "ring" would have evsry farmsr believe that there are again, this year not ships enough to frsight the wheat, and having nsarly all the tonnage to thsmsslvss, up goes the freight.

Now the facts undoubtedly are, that the crop cannot possibly excesd that of last year, and as there are ships enough chartered to take the whole crop away in reasonabls time, the probability is that if farmers do not crowd ths markst till it absolutely chokes, there will be no riss in freight. Lst the farmers hold on to every bushsl of wheat they can till it is wanted, actually callsd for to complets cargoes and a fair prics will be obtained for evsry bushel of our surplus.

There ars several large farmers in different parts of the State, who are making arrangements to store their grain in bulk, determined that the rapacions maw of the middlemen and "ring" managers shall no longer nttsrly consnme the whole cost and profit of production.

The farmers through the action of the Granges should combine—and in a year or two will—and procure their own ships and ship their own wheat; and show to the plundersrs of their hard earnings, that they are entirsly competent to manage thsir grain interest, and possibly to some considerabls extent the political affairs of the State.

Sounding the Pacific.—The Navy Department, for several days past, has had under consideration a proposed lins of soundings, between the Amsrican and Asiatic continents, acrose the Pacific ocean. Instructione have besn sent to Commander Belknap, commanding the U. S. eteamer "Tuscarora," in this city, in regard to the immediate execution of thie work. It is proposed to make two lines of soundings—one on the arc of the great circle, and the other by a more sontherly route. The former will run cloee to the Aleutian Archipelego, and will probably touch at one of the islands of the Japanese group. The "Tuscarora" will sail some time during Angust.

Copper.—The Pueblo *Chieftain* says: The copper mines near Cañon city are being very setisfactorily developed, the ore taken from the lodes four or five feet in width bearing 52 per cent. of copper. Meesrs. Paine, Allen, Dickereon and Jennings are abont to erect copper reduction works, to bc completed some time during the summer.

The mines in Husdler, in Victoria, have yielded a profit to their English shareholdere of £400,000 since the month of October, 1871.

Useful Information.

Care of Guns.

A trns sportsman, like a good soldier, should alwaya be prepared for inspection, and keep his weapons in condition for immediate servica. On his return from a day's shooting, beforo ha lies down to rest, he should see that his gun is fit for service on the morrow. At the end of the shooting season it is much mors important that thia should be done at onca elss it may he forgotten, and a favorits and a valuahls wcapon injured beyond ropair by silent corrosion. To prevent this, here is a preparation which we havs used for years aud which we know to be good: Twenty ounces hest olivs oil, one ounce and a half spirits of turpentine. This should he rubbed on ths gun-harrels, outside and in, with a rag; leave all that adheres to the barrels, and put the gun away until wanted. Do this and yon may bid defiance to rust, aven in the rainy season of California.

How to Clean a Gun.—No one should put away a gun without cleaniug, not even if it has fired hnt one shot, that ono harrel ahould hs cleaned. First take ths barrels off the stock, and immerss them in cold water ahout four inches deep. Then wrap some stout cloth (tow clings to the barrels, and leaves particles in them,) about the cleaning rod, so thick that yon will have to press rather hard to get it into ths barrels; then pump up and down, changing ths cloth till the water comes out clear; then pour hot water into them, stopping up the nipples, and turn them muzzles downward. Then put on dry cloth, and work till you can fesl the heat throngh ths harrels, and the cloth comes out without a particle of moisturs on it. Theu put a few drops of clarified oil (made hy putting rusty nails into good salad oil,) ou the cloth and rnh the insides; rub the outsides all over and then put the gun away.

Jumping.—Mr. Wilson, an English professor of gymnastics, writes as follows on the subject of jumping: A high jumper will clear fivs feet, a first rats one five feet aud a half, and an out and outer among the first rates, six feet. The late Mr. Ingleby of Lancaster, we have seen clear a stick held six feet two inches high, springing off the turnpike road with a run of about five yards. What Ireland could do without the spring board we know not—probably not two inches more than Mr. I. Mr. Inglehy despised perpendicularity, and swayed himself over almost horizontally with singular grace, elegance and facility. Twelve feet is a good standing single jump on level ground; fourteen is a job for two or three in the country; twenty feet is a first-rate running single jump, hut has heen done often; twenty-one is something very extraordinary, hut noways apocryphal; and twenty-two is, we believe, accomplished ahout once every twenty years, and that almost always by an Irishman. A hundred sovereigns to five against any man in Engiand doing twenty-three feet on a dead level. With a run and a leap, on a slightly inclined plane, perhaps an inch to a yard, we have seen twenty-three feet done in great style, and measured to a nicety; hut the man who did it (aged twenty-one, hight five feet eleven inches, weight eleven stone) was admitted to he (Ireland excepted) the best fair leaper of his day in England.

Facts About Ropes.—"Alston's Trestise on Seamanship" gives the following facts and rules for computing the strength of ropes:

"To find what size rope you require, when roven as a tackle, to lift a given weight, divide the weight to he raised by the numher of parts at the movahle block, to obtain the strain on a single part; add one-third of this for the increased strain hrought hy friction, and reeve the rope of corresponding strength.

"One-sixth of 40 tons is 6⅔ tons, which, with one-third added, is 9 tons nearly, for which you should reeve a six-inch or six and a half inch rope.

"Conversely—To find what weight a given rope will lift when rove as a tackle: Multiply the weight that the rope is capahle of suspending hy the numher of parts at the movahle hlock, and substract one-fourth of this for resistance.

"Thus: 8-9 tons, the strength of the rope, multiplied hy 6, the number of parts at the movable hlock, minus 13-3, or one-fourth, gives 40-1 tons as the weight required.

"Wire rope is more than twice the strength of hemp rope of the same circumference; splicing a rope is supposed to weaken it one-eighth.

"The strongest description of hemp rope is untarred, white, three-stranded rope; and the next in the scale of strength is the common three-strand, hawser laid rope, tarred."

Adulterating Tea.—That sugar can be 'sanded" is too well known hy the grocers to admit of dispute; hut the process of "doctoring" tea ia a trick prohahly peculiar to the Chinaman. Dr. Lethehy, of London, a well known sanitary statist, made an examination into samples of this article obtained from honded warehonses, which he found to contain from forty to forty-three per cent of iron filings and nineteen per cent of silica, in the form of fine sand, which had been cleverly mixed with and added to the leaves before curling, with a view to increase their weight and bulk. After the leaves were curled they had been thickly covered with a green pigment. When it was infused in boiling water it produced a turbid solution, offensive to the smell and nauseous to the taste.

Wasp Trap.—It sometimes becomes desirahle to rid one's premises of the unpleasant presenco of numerous wasps, and hers is a way to do it as suggested by a cotemporary: Mount four panes of glass of equal dimensious in tin framing (liks a lantern), leavs the top and bottom open, cover ths latter end with thick white paper well attached with strong water-proof glue, and ths paper well oiled, and protected from damp or firs. In this maka a hols about six inches in diameter, and then placs this hole over a plate, on which three pieces of bricks aro put; in this plate you will havs put a mixture of beer, sugar, aud a littls rum. On the top end you will have fittod in a glass pano, removahls at pleasure, to clean ths tray. Now prepare soms long matches of stout paper dipped in brimstone; when your trap is "all alivs" with captives, ignito a match and put it under the hole, they will soon ho suffocated. Each day empty out the contents for your pet toad'a dinuer. I once saw a most ingonioua insect-catoher in Africa, invsnted hy soms English Artisan. Thera was a wirework dome like a meat-cover; just below it a roller covered with cloth, saturated in ayrup, slowly revolved when the clockwork adjustment had been wound up. Into this "Sirens cave" every flying thing tempted to settle on the sweet stuff was unconsciously drawn, and ths cags was soon a museum of Diptera and Hymenoptera! There was a trap-door at which the suffocating operation was carried out (as in the first mentioned trap). It was altogether a great success.

Enameling Cooking Vessels.—To enamel the insids of copper cooking vssscls, in which acid fruit and vegetahles are cooked, and thus prevent the formation of the so-called "verdigris," the following method is recommended: Twelve parts of unburnt gypsum aud one part horax are finely powdered, intimately mixed, and fused in a orucible. The fused mass is thsn poured out, and after cooling, is rnbbed up to a paste with watsr. The copper vessel is to be coated inside with this preparation, applied hy means of a hrnsh, and the vessel placed in a moderately warm place, so that ths coating may dry uniformly, after which it is subjected to a gradual increasing heat, till at length the preparation fuses. On cooling, the vessel is found to be protected iuternally hy a white opaque enamel, adhering very firmly to the copper, not chipping off hy ordinary knocking and rnbbing, and impervious to vegetable acids.

Curious Facts in Science.—Science has elicited many curious facts respecting water, among which are suhjoined. Of every twelve hundred tons of earth a landholder has in his estate, fonr hundred are water. The snow-capped summits of Snowdon and Ben Nevis have water in a solidified form. The air we hreathe contaius five grains of water to every cuhic foot of its hulk. The potatoes and turnips which are hoiled for dinner have, in their raw state, the one seventy-five per cent. and the other ninety per cent. of water. If a man weighing ten stone were squeezed flat in a hydraulic press, seven and a half stone of water would run out, and ouly two and a half dry residue remain. A man is chemically speaking, forty-five pounds carbon and nitrogen, diffused through five and a half pailsful of water.

Uses of Willow Wood.—In Eugland there are few varieties of wood in greater demand than good willow wood, of good size. It is light, smooth, soft and tough, will take a good polish and does not easily burn. It will hear more pounding and hard knocks, without splinter or serioua injury than any other wood, and hence it is used for cricket hats, and whenever it can be obtained in good condition and of suitahle size—for the floats of steamer-paddles, "strouds" of water-wheels, break-blocks for luggage and coal trucks, etc., where the wear and tear is considerahle. To the wood-turner it ia invaluahle, and were it grown as timher, and obtainable, it might he largely used for very many purposes to which timber is now applied, and that too with considerable advantage to both consumer and producer.

The Earth's Density.—As the density of the earth is equal to a solid globe of gold—the heaviest of metals—of nearly 6,000 miles in diameter, instead of 8,000, the full diameter of the earth, the question naturally arises as to what can that centre portion he composed of, which offers such an incalculahle resistance to the centrifugal motion of the planet on its axis, a velocity of 1,100 miles a minute for its equatorial regions.

From Joppa to Jerusalem by Rail.—Under the ahove head the newspapers are announcing, as a new illustration of modern progress, that travelers are now taken over that historic road hy rail. The truth is that the *surveys* for a railroad over that route have lately been completed, and plans sent to Constantinople for the consideration of the Minister of Puhlic Works.

Over one hundred and fifty kilns are engaged in making crockery ware exclusively, in the United States. These kilns are capahle of producing at the rate of ahout $30,000 worth of ware each per year, making a total, for all of nearly $4,500,000 per year.

Lime to the Ton.—When hot from the kiln, twenty-six and a half bushels of gronnd lime go to the ton; but after keeping some time a ton swells to thirty hushels. A bushel of fresh lime may be taken at one-seventh more than a bushel of stale lime.

Good Health.

Bathing.

Bathing is not only an act of cleanliness, but is in an eminent degree conducive to health. Ths fine and sensitive pores of the skin soon become torpid and their delicate and most important functions are suspended hy tha aolid materials in the perspiration, and the accumulations of filth, and require very frequent ahlution, with water, to preservs their normal condition, without which no person can be healthy, happy or God-like in any sense. The mers wearing of proper clothing and washing of the more exposed portions of ths hody, and the frequent changing of clothing, is hut an imperfect attsmpt at oleanliness, without being accompanied hy entire submersion of ths body in water, either tepid or cold. It must be admitted hy every sensible person, that there is no more real appreciative luxury than a pleasant warm gensral bath when ths system is in a *proper condition* to receive suoh bath; it is, in fact, ons of the most valuahls but most neglscted hygienic remedies we possess.

We admit that many people aro susceptihle of taking cold, and ars, so to speak, "*living barometers;*" but evsn to such ths warm bath would always prove advantagsous. One half or mors of the rheumatic twinges, swollen limhs, and cramped joints that occur in suoh persons, would yield to proper perseveranoe and confidence in this potent alleviator. For ordinary purposes, cars must hs taken that a warm hath is not used at too high a temperature at first. As a general rule ws would adviss, niors especially in cases whers some chronic disease is firmly located, using the warm bath for a few days, first followed hy the tepid hath, then ths cold. In *all* cases, whsther the warm, tepid or cool hath is nsed, the first should be of only a few minutes duration, which may soon be increased to fiftesn or twenty minutes at a tims, care being taken never to remain immersed sufficiently long to induce a sensation of cold on coming out. A healthy reaction should follow the hath, and a pleasant glow of warmth should diffuse itself over the surface of the body. If this he not the case, the bath has heen indulged in too long, or injudiciously taken. When any symptom appears that contra-indicate the use of the cold hath, the tepid, warm or vapor bath may be suhstituted, according to circumstances; the spirit vapor hath especially, is one of our most safe and valued curative and porphylactic agents.

In conclusion we would say to *all*, keep the skin free and active in health or disease by some kind of bathing, the frequency of which must of course depend upon all the surroundings and conditions of each life in all that pertains to hahits, etc., etc.—*Ex.*

Cooling Off.

Every ohserving farmer knows that men and horses are the only animals that have douhle means of refrigeration, and all others have hut one. No other heings sweat like men and horses, and therefore cannot cool themselves hy perspiring through tha skin. This will ha found trne throughout the whole range of comparative anatomy, and applies to the largest as well as the smallest beings. All the thick-skinned animals except the horse, have powers in the skin to exhale heat by perapiration, it being only a secretive surface. All the cleft-feet species, including those with feet and toes rounded and unprovided with claws, the rhinoceros, elephant, bison, mastadon, huffalo, swine, ox, deer, lion, tiger, hear, wolf, fox, squirrel, dormouse, opposshm, raccoon, all, like the dog, have no means of cooling themselves, when heated, except through the medium of respiration. Thus the ox, when very hot, thrnsts out his tongue and pants, to exhale the heat generated hy exercise; and if driven without time allowed for this, will die with the heat that accumulates within him.

Hogs perspire mainly through their fore legs. There is a spot on each leg, just helow the knee, in the form of a sieve. Through this the sweat passes. And it is necessary that this is kept open. If it gets olosed, as is sometimea the case, the hog will get sick; he will appear stiff and cramped—and unless he gets relief it will go hard with him. To cure him, simply open the pores. This is done by rubbing the spot with a coru-cob, and washing with warm water. Hogs often die when driven too fast, hecause they cannot readily part with their generated heat.

Brain-Work and Brain-Worry.—This is the text of a good hygienic discourse in a foreign journal, and the "conclusion of the whole matter" is as follows: "Brain-work is conducive to health and longevity, while hrain-worry causes diseases and shortens life. The trnth of the statement, and its application to what we see around us, is evident enough; yet it is well that such subjects should be continually discussed. Intellectual labor, although severe, like that performed by the judges of our higher courts, or hy scholars and persons devoted to literary pursuits, if nnmixed with excitement, and followed with rsgularity, is seen to promote hodily health and long life. On the other hand, mental cares, attended with suppressed emotions, and occupations which from their nature are subject to great vicissitudes of fortune, snd constant anxiety, hreak down the lives of the strongest. Every ons has seen a class of meu whoss early mental training was deficient, and to whom the writing of memoranda was irksome, engaged in middle life in grsat undertakings, and taking the memory with a mass of complicated business accounts, simply because they could more easily remember than write. Their power of msmory for a certain kind of facts is trnly astonishing, but the strain is at last too much, and they die befors their time. Ths brain-worry of our school children might furnish usefnl illustrations of ths truth of the same general proposition, hut we forebsar."

Domestic Economy.

Ripe Bread.

Bread mads out of wheat flour, when taksn out of ths oven, is unprepared for the stomaoh. It should go through a change, or ripen hsfora it is eatsn. Young persons, or persons in ths enjoymsnt of vigorous health, may eat bread immediately after being baked without any sensible injury from it; hut weakly and agsd persons cannot; and nons can eat such without doing hsrm to ths digsstivs organs. Bread, after heing baked, goes through a change similar to ths change in newly hrewed heer, or newly churned buttermilk, neither being healthy until after ths change. During the chsnge in bread it sends off a large portion of carbon or unhealthy gas and imhihes a lafgs portion of oxygen or healthy gas. Bread has, according to ths computation of physicians, one-fifth more nutriment in it whsn ripe than when just out of the oven. It not only haa more nutriment, hut imparts a much greater degree of cheerfulness. Hs that sats old, rips bread will havs a much grsatsr flow of animal spirits than he would wers he to eat unripe hread. Bread, as bsfors observsd, discharges carbon and imhihes oxygen. One thing in connection with this thought should he particularly noticed by all house-wives. It is, to let the bread ripen where it can inhale the oxygen in a pure state. Bread will always taste of the air that surrounds it while ripening; hence it should ripen where the air is pure. It should nevor ripeu in a cellar, nor in a close cupboard, nor in a bedroom. The noxious vapors of a cellar or a cuphoard should never enter into and form a part of the bread we eat. Bread should be light, well baked, and properly ripened hefore it should he eaten. Bread that is several days old may he renewed so as to have all the freshness and lightness of new bread, by simply putting it into a common steamer over the fire, and steaming it half or three-quarters of an hour. The vessel nnder the steamer containing the water should not be more than half full, otherwise the water may hoil up into the steamer, and wet the bread. After the hread is thus steamed, it should he taken out of the steamer and wrapped loosely in a cloth, to dry and cool, and remain so a short time, when it will he ready to be cut and used. It will then be like cold new hread.—*American Farmer.*

Root Beer.—As the season is now upon us when the greatest demand exists for this popular heverage, it may interest some of our readers, to learn that it is most satisfactorily made by a process similar to that used for soda water. If the old method of fermentation ba adopted, it requires that a numher of specialties for it he in constant use; that the root beer is only in the right condition for use during a limited time, and if kept on hand too long, it runs into the acetic fermentation and gets sour. By the soda water method it can quickly be made, is ready for use at once, remains good until all is drawn off, and does not sour. We give the following process, employed with great satisfaction hy a correspondent of the *Druggist Circular:*—

Sugar house syrup, or nics molasses	½ gallon.
Knapp's extract for root beer	1 ounce.
Caramel (to color)	1 to 2 ounces.
*Flavor for root beer	1 ounce.

This may he kept ready mixed in a bottle, and, when necessary, is put into a soda water fountain, with four and a half gallons of water, and then charged with carhonio acid to a pressure of 80 or 100 pounds to the square inch, as indicated by the usual gauge upon the apparatus. Those of our readers having a soda water apparatus can readily use one or more fountains for this purpose with both convenience and profit.

*Flavor for root beer:—

Oil wintergreen	4 drachms.
Oil sassafras	2 "
Oil Cloves	1 "
Alcohol	4 ounces.

Mix.

Adulterations in Olive Oil.—Olive oil ia very generally adulterated with poppy or lard oil. Such adulterations may be detected as follows: dissolve six parts of quicksilver in seven and a half of nitric acid of a specific gravity of 1.36—dissolve without heat. Add one part of this freshly prepared solution of nitrate of mercury to ten of the oil. If the latter be quite pure the mixture will solidify in from three to four hours. Fish oils may he detected in vegetable oils by the red tint they give; whon the oil to be tested, is mixed in the proportion of five volumes to one of sulphuric acid; or in the same way with similar effects, you may use a solution of caustic soda, of the specific gravity of 1.34

MINING AND SCIENTIFIC PRESS.

CENTRAL PACIFIC DIRECTORS.—The annual election of the Central Pacific Railroad Company for Directors was held at the office in Sacramento on the 8th inst. The following gentleman were elected Directors for the ensuing year, without opposition: Leland Stanford, C. P. Huntington, Mark Hopkins, E. H. Millor, Jr., Robert Robineon, C. H. Cummings and Wm. E. Brown.

REPORTS from Wyoming state that extensive placer mines have been found near the head waters of the Big Laramie River and its tributaries. It is said by people from there that there are 40 or 50 miles of gulches that will pay $10 per day to the hand.

AN EXPEDITION is being fitted out in this city to fish for pearls on the Mexican Coast, on this side, as far down as Panama. A diving bell is to be used—the same tried in fishing for gold sands at Gold Bluff.

THE recent warm weather has cleared all the Utah cañons of snow, and the shipment of ore is going on on a grand scale. Times are reported lively at Alta, more miners being employed than ever before.

THE new quicksilver mines, from twelve to fourteen miles from Healdsburg, are sending in quicksilver to that town. The opening of the mines has just commenced.

ANDERSON'S School of Natural History, Pescadero Island, under the supervision of Professor Agassiz, opened on the 8th inst.

SILVER-BEARING quartz is said to have been found in the Coast Range of mountains in Clateop county, Oregon.

THE first locomotive for the Pioche and Sevier narrow-gauge railroad arrived in Salt Lake City this week.

BORAX.—It is stated that parties in this city have paid $10,000 for a horax mine in Kern county,

The Explosion at Virginia---Nitro-Glycerine and Its Compounds.

The fearful explosion at Virginia City, which occurred on the 29th ult., and caused such great loss of life and property, is still fresh in the minds of the people, and the feeling gains ground that its origin should be thoroughly investigated. That large amounts of explosive compounds should be kept in a dwelling-house in the center of a populous town, is strange enough, especially when the dangerous nature of the substances in question is well known. The impression prevails, and is corroborated by direct testimony that experiments were being made with explosive compounds by one of the victims — General Van Bokkelen — in order to invent an explosive that would take the place of Giant Powder. The local papers state that six cans of nitro-glycerine were stored under the bedroom of the gentleman referred to, a few days previous to the accident. It is also stated that a quantity of Giant Powder, Hercules Powder, and common black powder, as well as gun-cotton, were in the building. It could hardly have been possible to have collected in one spot anything more likely to cause an explosion than these substances; and to make them even more dangerous, a pet monkey was kept in the room. If the experiments referred to have been going on for any length of time, the only wonder is that the accident did not occur before it did.

General Van Bokkelen was acting as sort of agent for the sale of Giant Powder in Virginia. He was paid a commission on his sales, as are others in the same business. Some of the large companies on the Cometock, who use quantities of the powder, preferred to buy of the principals in this city, both on account of becoming dissatisfied with Van Bokkelen's manner of doing business, and tho fact that the article could be purchased here with the commission paid to agents deducted. Van Bokkelen demurred to this action of the company, but they insisted on their right to sell without the interference of the middle-men, and he resolved to invent a powder of his own. To this end experiments were instituted with nitro-glycerine, gun-cotton, etc. That these things were present there is no doubt; that Giant Powder was in the building there is a doubt. At the coroner's inquest, Frank M. Thayer, a mining Superintendent, who has been employed at the Savage, Julia and Arizona and Utah mines, and who is familiar with Giant Powder and its odor, did not detect any smell of that compound at the time of the explosion. The company state that there was none there at the time. The Hercules Powder company, a rival to the Giant Powder company, reduced the rates of their powder a short time since, and the latter company were forced to do the same, lowering the rate from $1 to 75 cents. In April the Giant Powder company sent a man to Virginia to take account of the powder in the hands of Van Bokkelen, and other parties in Gold Hill and Silver City, who were acting as agents. This was done that the amount they had on hand should be sold to them at reduced rates as well as what they were then buying, for obvious reasons. At that time Van Bokkelen stated that he had from 50 to 60 cases in the magazine and 10 in Smith's hardware store. He would not be likely to conceal the presence of other boxes, as he would have to pay $1 instead of 75 cents per pound for it when settling up. Since then only 25 cases have been sent up which were for one order.

At that time the Giant Powder Company's traveling agent, Mr. White, was in Mr. Van Bokkelen's room with him. He is now in Utah, but immediately on hearing of the explosion, he wrote to the company in this city, and as his letter throws some light on the subject, we have been permitted to copy it. It is as follows:

OPHIR CANON, UTAH, July 2d, 1873.

BANDMANN, NIELSEN & CO., SAN FRANCISCO.

Dear Sirs—Have just seen the telegraphic account of the terrible explosion in Virginia City, in which it is stated that 150 pounds of Giant Powder, together with six cans of nitro-glycerine and 200 pounds of black powder, were exploded. As far as the Giant Powder is concerned, this is a mistake. Gen. Van Bokkelen kept his supply of Giant Powder stored in the magazine of J. P. Smith, and had for many months past. As you entered the General's office on B street, in the first corner to the right, were two sample cases of Hercules Powder; one case of Hercules Powder and gun cotton saturated with nitro-glycerine, and one case of cotton pulp saturated with nitro-glycerine. These cases were about the size used by your company; and, as Gen. Van Bokkelen was for some time your agent in Virginia, to the casual observer, the cases would pass for those of the Giant Powder Co.; but the two cases of Hercules Powder were so branded, while the gun cotton and cotton pulp were branded "Powder Cartridges," from the California Powder Co., and the shipping mark was "J. P. Smith, Virginia," with J. S. V. in the lower left hand corner. When I visited Gen. Van Bokkelen to take account of his stock and settle his accounts with yourselves, as the General Agents of the Giant Powder Co., he told me he would soon have a blasting agent in the market that would excel Giant Powder. On my asking what it was, he turned to the above mentioned cases and opened them, showing me the gun cotton saturated with nitro-glycerine, together with the cotton pulp mixture. (It was this fact that caused me to particularly notice the marks and brands on the cases.) During this conversation, Gen. Van Bokkelen said, "White, when I get this fairly started, which will be in about six weeks, I'll give you $300, and expenses per month, to introduce it to the mining public." And, I presume, it was for the purpose of making these cotton-nitro-glycerine compounds that he had the six cans of nitro-glycerine. Any of the attachees of J. P. Smith's hardware store will tell you Van Bokkelen *always* kept his order book there; and they attended to his powder business during his absence, and will confirm my statement as to the Giant Powder being stored in Smith's magazine.

Yours, truly, OSCAR W. WHITE,
Traveling Agent G. P. Co.

Mr. Kent, at the inquest, testified to having seen the General making experiments with cartridges in his room. Mr. Searles testified that there were two boxes in his room that looked like Giant Powder, and the General told him to be careful in handling them, as they were probably the gun cotton. Mr. Kellogg, foreman of the Crown Point mine, testified that the General, not long ago, wanted him to try a preparation of gun cotton and nitro-glycerine at the mine, saying it was as safe and effective as Giant Powder. Kellogg refused to try it, as the agent of the Hercules Powder Company, who had experimented with it, said it was not safe. Van Bokkelen had about 25 pounds of it at that time. Other testimony goes to prove that experiments were being made to get a substance to supersede Giant and Hercules powder.

The unfortunate result of these experiments ought to warn others who are ignorant of chemistry from meddling with substances, the nature of which they do not understand. Nitro-glycerine, particularly is a most dangerous substance to handle, even with the greatest care. As a general thing it is made on the spot where it is to be used. It is against the law to transport it on steamers or railroads. The Giant Powder Company in this city never even keep it over night. It is made in the morning and turned into Giant Powder at night, to prevent accidents.

As the nature of the substance is little known we are confident that some account of its manufacture and properties will be read with interest. Nitro-glycerine is made from a mixture of nitric and sulphuric acid, one part of the former and two of the latter. Into this is introduced slowly a small stream of glycerine; the mass is kept constantly stirred and cooled. The nitro-glycerine forms by this process and while it is in this mixture swims on top of the acids on account of its specific gravity. The whole mixture is now run into water, and it is repeatedly stirred in the water in order to completely free it of all acid. It is washed in three different waters and an alkaline substance added to neutralize the acids. If any acids remain it is very dangerous or it is liable to explode, and this was the mistake made which led to so many accidents. After stirring it in the large bodies of water, it was sometimes allowed to remain, and as it was heavier it sank to the bottom. It was supposed that the water would protect it from all chemical action and danger of explosion; but on the contrary it seems that it was not in all instances completely freed from acid and the result was a chemical action of the acids on the nitro-glycerine, causing heat and a generation of gases.

Now, if this process of decomposition occurs without being confined under water or otherwise, the nitro-glycerine is set on fire, and burned up; but if the decomposition is allowed to take place under a considerable weight of water, or is otherwise confined, the gases cannot escape freely, and an explosion follows. For this reason all manufacturers of nitro glycerine are careful, in addition to washing the substance thoroughly, to apply an alkaline substance to neutralize any trace of acids that may remain. The secret of securing the safety of nitro-glycerine from explosion, lies in "cushioning" it. The sharpness and violence of the concussion of a blow is what explodes it. A nail can be driven in by a blow, not pushed in unless with great force. The principle is simple, and well understood. If a soft substance is placed between the nail and hammer the blow has little effect. The nitro-glycerine is put in a cushion, so to speak. There are different substances used for this purpose, the best of which is infusorial earth. When in that condition you might as well try to drive a nail with a sand bag, as explode it by concussion. It is then Giant Powder. The *infusoria* in the earth used, form so many little tubes, the force of capillary attraction absorbing a large amount of nitro-glycerine, which is cushioned in this manner. Every material with which nitro-glycerine is mixed which has not these absorbent properties in a high degree, is dangerous, for if by any means nitro-glycerine runs or is squeezed out, you have all the original dangers of pure nitro-glycerine. Common gunpowder absorbs a considerable portion of nitro-glycerine, but is more dangerous than infusorial earth, as it comes out easier. It will hold about 55 or 60 per cent. while the infusorial earth holds 75 per cent. In warm weather it exudes from the powder badly.

Cotton is a poor absorbent and very dangerous; chalk also; magnesia is a good one. The present Herculee powder, which used to be made of black powder and nitro-glycerine is said to be made with magnesia, and in ordinary temperatures may be deemed a safe absorbent. The higher the temperature the more liability to leakage in all of these substances. These compounds explode more readily according to temperature and wetness or exudation.

Giant Powder, formed of nitro-glycerine, is well known in the East, and has been used in large quantities here since 1868, and in Europe since 1867. No accidents have ever occurred with it in transportation. It never has exploded where the blame was chargeable to the powder. The Austrian Government having first prohibited its transportation on railroads and stages, in 1869 reversed the law, it having been proven that it was perfectly safe. It is carried everywhere on this Coast. There are five factories of it in Europe, one in this city, and one in New Jersey. The consumption is from 1,500,000 to 2,000,000 pounds per year, carried about in every possible way. All the explosions which have occurred in this city were caused by nitro-glycerine, not powder. At the only explosion ever occurring here, at the Giant Powder Company's Works, in 1869, when the nitro-glycerine blew up, there were 5,000 pounds of Giant Powder within thirty feet of the nitro-glycerine, which was unharmed. The concussion blew open the boxes, but did not explode the powder. The nitro-glycerine was left under water at that time, which caused the explosion, as spoken of above. Very recently, when the steamer "Meteor" burned up, on Lake Michigan, there were 8,000 pounds of Giant Powder aboard, which all *burned* up, with the entire cargo, without any explosion, whatever. Here are two simple cases illustrating that it will not explode by ordinary concussion, or by the action of heat.

In the matter of heat it is peculiar. It can be burnt. If a small particle of the powder is put on a bar of iron, one end of which is in a fire and red-hot, the red end will burn it; the cold end has no effect; but on the part where there is a dull heat there will be a semi-explosion or detonation once perhaps in thirty or forty times in trying it, but not uniformly. Put this in a gas pipe under similar conditions and it will explode violently, being confined. But unless the confinement is such as to restrain the gases it will burn up. In tin vessels or wooden boxes there is no explosion, but in a quicksilver flask closed tight, it would burst. The large caps made for the purpose are the only things that will explode it. If a small piece of Giant Powder is placed on a hard substance and ground up fine by rubbing with a knife for some time, and then struck it will explode. But then it is nitro glycerine, not powder. In grinding, the capillary tubes are destroyed, the powder turns from white to brown and then darker, while a dampness is perceptible, showing that the nitro-glycerine has exuded or been forced out. These conditions are not likely to occur in every day use of the powder.

It will be seen from the foregoing what danger there was to ignorant persons to experiment with nitro-glycerine and its compounds. If the nitro-glycerine used was not thoroughly washed free of all acid, it is likely to explode at any time. If the gun cotton exuded the nitro-glycerine, as it would, the slightest jar would be sufficient to explode it. All these experiments were made by Nobel, the patentee of Giant Powder, when first inventing his compound. They were all found to be dangerous. The use of black powder was at that time and since, tried, but discontinued, for it would not hold the nitro-glycerine in warm weather and was therefore dangerous. It is not possible that the explosion was caused by Giant Powder, but nitro-glycerine either pure or mixed with the gun-cotton. To show that a concussion will not explode Giant Powder and that the nitro-glycerine explosion could not have set it off, the instance of the violent explosion in this city may be cited, as well as many others. In England, very recently, a box of the powder was put on the buffer of a car, which was allowed to run down a grade and collide with another violently, smashing up both cars, but no explosion took place. The flames would burn but not explode it.

The verdict of the Coroner's Jury, convened at Virginia to hold an inquest on the bodies of several who were killed, states that the jury believe that the explosion was caused by gun cotton saturated with nitro-glycerine in the deceased Van Bokkelen's room. It is not likely that the nitro glycerine was made there, but must have been shipped there by parties unknown. In doing this the law was not only violated, but people's lives were endangered while it was *in transitu*. The poor fellows who were making the experiments lost their lives by them, and others suffered from their ignorance and carelessness. It is to be hoped that what we have said will deter others from experimenting in the same direction, without a thorough knowledge of the conditions under which nitro glycerine will explode, and even then the utmost precautions must be taken to prevent explosions.

Academy of Sciences.

At the last meeting of the Academy of Sciences, the following members were elected: W. S. Chapman, (Life); Major Geo. H. Mendell, F. A. Bishop, John C. Robineon, F. A. Miller, O. Button and J. W. Claes.

A number of donations were received. Among them a skate's egg, a number of stuffed birds, a peculiar specimen of crawfish, a female tarantula and eggs, in her nest, and several mineral specimens.

Prof. Davidson explained the character of the instruments used in triangulation, and the various modifications made in their construction for the purpose of more readily determining the distance of any given object from the point of observation, illustrating his remarks on the blackboard. He stated that he hoped to be able at the next meeting of the Academy to show an instrument of his own invention, with which he could determine the exact distance from the point of observation to any given object, by a new method.

R. E. C. Stearns, read a long and interesting paper on the money of uncivilized man, more particularly referring to wampum, or different kinds of shells.

The President stated that C. E. Watkins, the photographer had offered to furnish a cabinet photograph of each one of the members, provided the Academy would furnish an album to contain them.

To Obtain a Patent.

Editor Morning Call:—As the *Call* seems to be posted pretty much upon all topics, would it be kind enough, in the present instance, to inform an old and regular subscriber, through its columns, the way to apply for a patent. No one hereabouts seems to have any knowledge of the matter. No matter where you inquire, you are as once referred to those agents who make it a business, and who expect a round fee for their services—too much. Furthermore, you are compelled, in employing those parties, to disclose your secret, which is something altogether too hazardous, as not a few have found out to their cost before now. What your subscriber desires to know, is, how to place his application before the Commissioner of the Patent Office at Washington, in such shape as to have his business properly recognized, without the aid of the "middle man," the cost of the fee, and where to get the proper blank, and how to send it, and when to expect a notice of his application at the hands of the Commissioner. The way to obtain a copyright is simple enough. But proper information in respect to a patent is not so easily reached. By giving this information you will confer a favor, doubtless, on many of your readers. The money that might be required to fee the agents might not be so great an obstacle. It is the cold fact that you are placed in the power of those who might take advantage of your plans and inventions, and so work it to your loss and confusion, which they palpably could. Trusting that my meaning is clear, and hoping that the favor will not occasion too much trouble, your respectful subscriber signs himself, INVENTOR.

San Francisco, July 5th.

[We can do no otherwise than to refer "Inventor" to some respectable and responsible patent agency. "Inventor" would not attempt to defend an intricate and difficult lawsuit without the aid of a lawyer; and in obtaining a patent, just as a claim before Government, it is best and cheapest to secure an efficient and experienced agent. We never heard of one of these stealing a man's invention.—*Ed. Call.*]

The above letter published in the *Morning Call* of this city, during the past week, fairly illustrates the feeling of a class of people in every community, in regard to Patent Agents. While we stand ready to acknowledge that all Patent Agents are not immaculate, we do deny the sweeping charge made by "Inventor." He certainly never talked with any person who had ever done business through the SCIENTIFIC PRESS Patent Agency.

It is the same with Patent Agents as it is with lawyers, doctors, preachers or the members of any other profession. Either can do a community a vast amount of good, or a vast amount of harm, according to his manner of doing business. The inventor however, has one consolation, and that is, that a patent agent who abuses the confidence of his clients is sure to reap the result of his errors, by being avoided by subsequent inventors. The best test in the world to prove the standing of any professional person, is to find out what his old clients think of him. If they recommend him, and give him their business, why should you distrust him? Dewey & Co have conducted a Patent Agency in connection with this paper, for the past twelve years. During that time we have procured over three thousand patents for Pacific Coast inventors, and we venture the assertion, that to-day not a man can be found out of the large number for whom we have done business, that will assert, that we ever attempted to take the slightest advantage of him or his invention. On the other hand you will find hundreds, and we might say thousands who will tell you that Dewey & Co., have, as faithful advisors, saved them hundreds of dollars, which otherwise would have been spent in a fruitless attempt to patent an old device, and further, these same persons will tell you that the Patent Agency of Dewey & Co. has disseminated a knowledge of patent matters amongst inventors on this coast, which they could not have obtained in any other way.

"Inventor" grumbles at the "fee" charged by Patent Agents. Did "Inventor" know that Dewey & Co. charge precisely the same fee for procuring a patent that New York or Washington agents charge? or, knowing this, does he wish to abolish Patent Agents entirely? He certainly does not expect them to exist and work for nothing. For the future benefit of "Inventor" we will give him this piece of information. Not only is it beneficial to the inventor to employ a competent agent to do his business, but the Patent Office in Washington prefers that inventors should apply through an agent. First: A patent specification is a legal document, requiring both legal and mechanical skill in its preparation, otherwise it will fail when you apply the test of the courts to its validity. Secondly: The rules, regulations and forms, required by the Patent Office to be observed, are continually being changed so that it requires the undivided attention of the agent to keep himself posted. We venture to say that every case presented to the Patent Office by the inventor himself, causes more trouble and annoyance to the Examiners than twenty cases presented by a competent attorney. These are facts that have been long established and we are familiar with a number of instances where the Examiner refused to proceed further with a case until a competent agent was employed and the case put into shape. In every such instance the application was made by the inventor and was found to be informal. The inventor, not being familiar with the rules, &c., of the office, each step he took placed his case in a worse condition than before, until finally nothing short of the skill of an attorney could get it into proper shape.

The Patent Agent should be posted not only in the legal and Patent Office practice, but his business is such that he becomes familiar with the existing state of all the arts. By making frequent preliminary examinations, he learns what has been done in almost every field of art and commerce, hence he is qualified to advise as to the novelty and patentability of any particular invention. There is a certain list of inventions which are reproduced every few weeks by enthusiastic inventors, who would rush "bald headed" for a patent, and pay out their money only to be rejected, were they not checked before hand; for instance, every few weeks we have some one to present us the model of a combined beer faucet and tap, the object of which is to draw beer from a barrel without driving in the cork. Within the past year this same device, without the slightest alteration, has been presented to us at least twenty times, and in each case we have saved the inventor his money by showing him the illustration of it in the Patent Reports.

We might recite numerous points of benefit which the inventor obtains by being able to consult a competent Patent Agent, but the above shows sufficiently the error of "Inventor's" statements. Let "Inventor" seek an honest, reliable, responsible and competent Patent Agent, and place his case in his hands, and we will warrant him that he will fare much better than if he attempted the business himself. To find such an agent let him go to those persons who have procured patents before him, and find out by enquiry whom to go to.

Supporting Attachment for Horse-shoes.

We illustrate herewith a device intended to keep horses from sinking in soft ground. It is styled a "supporting attachment for horse-

JORDAN'S HORSESHOE ATTACHMENT.

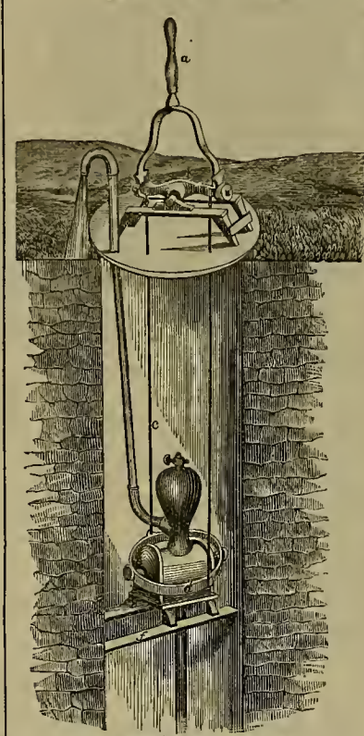
shoes," and was recently patented through the agency connected with this office by Robert K. Jordan, of Alameda county. The nature of the attachment can be easily seen by reference to the cut. It is an ordinary horseshoe, the heels or extremities of which are made longer than usual, and the extension thus formed bent outwards in opposite directions as shown. A metallic rim-plate of the desired width, (usually from an inch to an inch and a half) is bent so as to encircle the shoe; its length being greater than its width, so as to extend a short distance both in the front and in the rear of the heel and toe of the shoe. The sides of this surrounding rim-plate are secured to the outwardly bent extensions, by means of rivets or bolts, while the forward part of the plate is bent upwards and supported by a bar or plate from the toe of the shoe.

The bar or plate will usually be welded or permanently secured to the toe of the shoe when the shoe is made, and in fastening the plate to its opposite or upper end, a bolt or screw can be used so that when desired the rim-plate can be removed from the foot. The bar or plate shown stands upward at an angle, so that its upper end will support the forward end of the shoe at a point above the plane of the shoe, thus preventing the rim-plate from interfering with the stepping of the horse. The band which encircles the forward part of the horse's hoof can be used or not, as desired, but the inventor prefers its use, as it aids in binding the shoe with greater firmness to the foot; when it is used its opposite ends are also secured to the extensions at the heel, as shown. The attachment can be applied to worn out horseshoes if desired, as the character of the soil on which the bearing rim would be likely to be used, would not require that the shoe should be as perfect as is necessary on harder ground. The inventor claims that with this attachment to their hind shoes, horses can travel over ground in which they would sink to their knees if not provided with any supporting device. The attachment is cheap, simple and light, and Mr. Jordan thinks it will not interfere with the travel of horses after they once become accustomed to wearing it.

The Sluthour Pump.

We give this week an illustration of the force pump, for which letters patent were issued, April 9th, 1870, to Mr. Sluthour, of Ohio. The particular form represented is designed for mining or deep well purposes. It will be at once remarked, that the peculiarity of this pump lies in the fact that the power is applied at the ground level by the lever *a*, as seen in the engraving, and transmitted by connecting rods, *C*, *C*, to the working part beneath. When a large pump, requiring a driving engine, is employed, this proves a matter of great convenience.

"This pump," says the circular of the company, "has been approved (as a fire and bilge pump,) and adopted by the Supervising Board of Inspectors of Steam Vessels, and by



A DEEP WELL PUMP.

the Secretary of the Treasury; as appears by Circular No. 4, issued from the Treasury Department, Feb. 21st, 1872." For it are claimed the following advantages: Simplicity; durability; economy of power—it being stated that only one-third the power usually required, to drive any force pump of equal capacity, is needed by the Sluthour; and utility as a fire extinguisher, though applied ordinarily to other purposes.

Different styles are manufactured to meet varying requirements; in point of capacity ranging from the hand pump of ten gallons, to the monster steam pump delivering one thousand gallons per minute; and to be suitable for hand, horse, windmill or steam power. Those who may be interested in seeing the pump in practical operation, will do well to call at the warerooms of the Keeler, Hine and Thomas Co., 727 Market street, where it is on exhibition.

MINING DEPOSITS AND PATENTS.—Commissioner Drummond of the General Land Office, has decided that lands valuable on account of deposits of carbonate of soda, nitrate of soda, sulphur, alum and salt, may be patented under the mining Act of May 10th, 1872, as well as other valuable mineral deposits, except those specially reserved by Act of Congress.

RIVER MINING promises to be more favorable this season than for many years, along the Trinity; numbers of Chinamen are at work there.

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS]

By Special Dispatch, Dated Washington, D. C., July 8th, 1873.

FOR WEEK ENDING JUNE 24TH, 1873.*

ADDING MACHINE.—Gustavus Liuderoos, Point Arena, Cal.

CAR COUPLING.—Mordecai Disney, assignor to H. C. Kibbe and J. D. Hildreth, Oakland, Cal.

KINDLING WOOD-CUTTER.—Nicolas Sonnichsen, S. F., Cal.

SECTIONAL CAM FOR ORE STAMPS.—James M. Thompson, S. F., Cal.

ORE STAMP FEEDER.—John D. Cusenbary and James A. Mars, S. F., Cal.

PREVENTING INCRUSTATION IN STEAM BOILERS.—Roht. A. Fisher, S. F., Cal.

SHEEP SHEARS.—Andrew S. McWilliams, Colusa, Cal.

PLOW.—John C. Potter, Helena, Cal.

MORTISING MACHINE.—John Driver, Marysville, Cal.

PAINT BRUSH.—Syranus Standish, Eureka, Nevada.

MEDICAL COMPOUND FOR THE CURE OF CONSUMPTION.—William H. H. White, S. F., Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

San Francisco and the Interior.

An erroneous impression seems to have been in some way impressed upon the minds of many in the interior, to the effect that San Francisco is responsible for the excessive levies which are made upon the people, in the way of wharfage and dock charges; that San Francisco, in fact, sits at the Golden Gate as a toll-gatherer, taxing the industry of the interior for her especial benefit. We often find in the columns of our interior cotemporaries paragraphs like the following, which we clip from a late number of the Colusa *Sun:*

"We were informed by a Colusa County farmer that he had to pay one year four hundred dollars wharfage on his grain crop. Let the farmers' organizations inquire into this matter, and if there is any thing for the Legislature to do, let them demand that it shall be done. For one, we do not believe in letting San Francisco sit down at the Golden Gate like a toll-gatherer, and tax the industry of the country at such a fearful rate."

We fully agree with the *Sun*, that the Legislature should look after this matter, and free the State from the onerous burthen imposed upon her in the manner indicated; but we fail to see how San Francisco can be held responsible for such a state of things. If left to the people of this city, or their representatives, this burdensome tax could be removed at once. Indeed the only effort ever made for such removal was initiated and urged by the people of this city, and their representatives at Sacramento, and with such effect that the charges were reduced about one half.

The fact should be known and published in every interior journal that San Francisco has not one dollar's interest in the wharf and dock at this port; but that the Legislature both levies the dues and directs the disbursement of the moneys derived therefrom. This information should be published to the end that our interior friends may see to it that legislators are sent to Sacramento, next winter, who are opposed to such extortionate charges and by whose votes the thing may be done away with.

The interior delegations opposed to such excessive charges will be promptly aided by the delegates from this city. We say, with the *Sun*, "Let the farmers' organizations inquire into this matter," and see that no one receives *their* support for the next Legislature who is not all right on this important issue.

THE PRESSMAN'S GUIDE.—Too little attention is given to the press-work done in ordinary American newspaper printing. The setting of type on a weekly paper occupies the entire time of perhaps a dozen compositors, while the actual printing is done by one or two hands in 24 hours. And yet the fine appearance of the sheet depends as much upon the press-work as upon the composition. At least nine-tenths of all newspaper printing (except on daily publications) is done too hurriedly and at a consequent waste. It would therefore benefit publishers (as well as the eyesight of "many readers") if greater attention were paid to the press-work on newspapers. We know all this from 15 years experience and observation in printing.

To assist both pressman and publisher, R. Cummins & Co., of Brooklyn, have printed and offer for sale, for 50 cents per copy, a pamphlet bearing the same title as the heading of this item. It is a simple work containing hints, instructions, recipes, etc., which we dare say would repay nearly every publisher, pressman and apprentice in the Union to purchase and review.

Clarence King on Veins, Deposits and Limestone Formation.

The White Pine *News* is publishing *in extenso* the teatimony of Clarence King, the eminent mining expert, in the case of the Eureka Consolidetsd Mining Co. againat the Richmond Mining Co., of Eurska, Nevade. From the volnminous testimony elicited on the sxamination, we condsnss some interesting points. Mr. King firat stetes that hs is by profession a geologist and studied at the Yale Scisntific School, undsr Dana. He is now Director of the Geological Survsy of the Fortieth Parallel.

Q. How long have you heeu engagsd in that work? A. Sincs April, 1867.

Q. Havs you hed occasion while engagsd upon that survey to examine the mines of his coast? A. Yes, Sir.

Q. Ars you acqnainted with the Richmond workings on Ruby Hill? A. I am.

Q. You understand that map that is posted thers, I presume? [referring to the "mep of the Bichmotd mine of Eureke, 1872"] A. Yss, sir.

Q. Just describe in your own way how in your judgment that depoait of ore was formed there, the cavity formed in which it ia dsposited, how the ore was formed, and how it is classified hy gsologists, or how it would he classified? A.

The Geological Formation of Ruby Hill

Is qaite a simple one, the main mass of the Hill being formed of an underlying bed of quartzite, which is capped by transition strata of silicious limestone and followsd upward hy heavy beds of chrystalline mstamorphic limetsone. This hill, from its evident connection with ths othsr mouutains of the region, is the eroded fragment of e fold or mountain uplift. The strata of which it is compossd ers submarine in origin. They belong, as shown hy fossils discoverod here in them hy assistanta of my owu, to the silurian and devonian period, a very early period of the stratified rocks. Theee fossils also show thet it was an oceanic deposit. Other geological evidence gotten in here, and throughout the Great Basin, show that these streta were lifted from their submarine position at the close of the triassic period, and folded into mountains and permanently lifted above the level of the eea, in fact, at that time they reeched their present eltitnde above the level of the Pacific. Such an immense uplift aa this, with the consequent preesure in the axes of the folds, produces two great effects: the metemorphism of the strata and the fissuring of the strata.

Connected with euch deep-seated fissuring as must neceesarily take place in the folding of beds, which our survey has proven to he 30,000 feet thick, the fissures must necessarily penetrate to a great depth, and that they heve penetrated to a great depth is proven by the deep-seated chemical action which has made itself eviduot through these fiasures, resulting partly in mineral veins, partly in metallic mineral veins or lodes. In this especial instance, the evidence of uplift is preeent in the inclination of the main beds of the formation. The evidence of fissuring is present in the dislocation of etrata, the preaence of planes of fissuring, of cavities and of atiratiou of surface, indicating actual faulting. So far as that goes, we have them up to that point a suhmarine deposit lifted high into the air metamorphosed and riven with fissurea. Upon entering the Richmond mine at this point, B, where the old incline begius, we find ourselves immediately in ore, or within a few feet in ore, and following its workinge downward to this point (showiug) with a descent of about 140 feet, if I remember right, or 138, perhaps, to be more exact, were all the way in ore. That ore is composed of three recognizahle zones: that next the lower conntry rock, or silicious limestone, containing chiefly iron material impregnated with galena and carhonates of lead and eilver; a central zone chiefly occupied by carbonates of silver and lead colored with oxide of iron; and a third zone which usually caps the deposit, which is poorer; chiefly oxide of iron, whose tenure of oro, however, is carried up by gold.

The Presence of a Deposit

Of this character—I nse the word denosit not in a technical sense in which it hae heen nsed here, but in the generic sense, in which it is alone known to geologiats, ao far as I am aware—to include all those hodies of ore which are found in the eolid rock, or otherwiee all depoeite of ore. The presence of such a—or, I should go back a little further and etate that at three points in the Richmond workinga, having gone downward through the ore perpendicular to its general inclination, we come upon a surface of silicious limestone, which, in my opinion, is the definite foot-wall of the vein, and that in two or three places in the upward developments of the mine we come upon broken surfaces of limeetone more or less shattered in their surfaco, more or less impregnated for a little way with bunchea and stringere of ore, which I take to be the rough hanging wall of the lode. The preaence of a hody of ore like thia, enclosed in solid rock, can have owed its origin to only one, as I take it, of three possible causes: either it was laid down synohronously with the strata, that is upon what is now the approximste foot-wall of the vein, and npper country limestone waa laid down on the top of it; or elss it was poured in by the Divine hand from the top; or else, like other fissurea and true vsins, it percolated from a deep source. I shall brisfly examins thsse

Three Possible Theories

To see what ground is left ns to stand on. In the case of ors heds, as thsy are technically tsrmed, we have dsposits of various metallic minerals which ars absolutely a part of the stretification, following the plane of stratification resting upon the even surface of euhmarine deposition, in no case penetrating into the foot-well an inch or a foot; having a level surface of deposition on thsir own top and followed in the course of dsposition by the upper country rock in a smooth plane. Such deposts sometimss — often occur in iron and coal. end snch minsrals as that. The evidence as to the hsddsd origin of this vein ia very clear. In the firat plecs, the hody of ore doea not exactly follow ths planes of stratificetion, hut breaks into them here and thsre, and alongsids that within the solid body of ore are masses of limestone, which are termed "horses." Not going through like a continuous sheet, as if they had heen dsposited npon a top portion of the ore during the general dsposition of ore, hut terminating at their ends and of irregular form, therehy conclusively proving that the hody conld not have been deposited in the ordinary msthod of ocsanic deposition. To examine for a moment the othsr possible theory, that it was poured in from the top.

Ample Geological Evidence

Exiats that these mountaina, as I have said, since the close of the triassic psriod—a period anterior to even the chelk period of England—have hsan in thsir prssent positiona of elevations; and furthermore, that the only portions of the Grsat Besin that have heen since that period covsred by watsr, have heen covsred by fresh water lakes. They simply occupied the hroad meridinal depression of valleys or synical axes of thsse ranges, rssulting in proof to my mind absolutsly conclusive that these mountains have nevsr aince that period heen coversd hy watsr, and in order to suppose the mineral material to heve hsen poured in from ahove, we ehould have to have some Angel Gebriel with a pitcher, or some other superhuman enginery, to get this material in there; and the fect that it waa never done, ie proven by the conditions within the ore hody iteelf, for whenever yon pour a material into a cavity, it shows the resulta of stretification inevitably, which this does not; ehowing a hedding peralel iu a meaaure to the inclination of ite dip. Furthermore, in order to have the cavity to heve poured this meteriel into from ahove, it is necesaery that we should have had a fissure to begin with, for the weter percolating or flowing over eolid limeetone, haa not the power to eet or erode ite way into it. It must firet find some crevice, some fissure, some hole formed by dynamic agencies, into which it can percolate, and create the cavern, or aperture, or hollow, or whatever you wish to cell it. Therefore, I eay, thet it could not have been poured in from ahove, and that even if the evidence of stratification were preeent, of its having been poured in from ahove, it would necessarily have implied a fiasure to hegin with. I therefore rejeot these two propoeitions as ahsurd; the proposition of a bedded vein, or of a deposit poured in from ahove. I am therefore driven hack on the first theory,

That it is a Vein or Lode;

And I will as briefly as possihle examine the evidence which exiete hearing upon this question. In the first place, within the Richmond worke. I will indicate the points which I mean exactly. At this point here, (showing) just within the little arched mase of rock which overhangs the opening of that tunnel which rnns to the Richmond incline—

Mr. Hillhonse—(interrupting)—Juet designate it, if yon please, hy lettera as you go along, Mr. King, and we can get it down.

A. Well, it is in the immediate neighborhood of that B. I don't know within half an inch there on the map exactly the spot, for that little archway is not indicated. And underlying the hody of ore is a smooth, well-defined face of rock, possessing npon ite eurface marke of attrition or striation, the polish of movement, and differing altogether from the ordinary rough planee of etratification. Upon descending the main incline of the Richmond mine, and following thie lowest level to this point, (showing) the limeetone np to thiis time showing varioue evidences of fisauring and somewhat silicioue in its nature, shows at that point the same foot-wall equally smooth, equally evincing the lines of movement.

Q. What is that last point? Juat name it. A. The last point of that map is near the point E. Yes, sir; near the point E. At a third place, which is at this point N, the hottom of that ie also a moderately emooth enrface of eilicious limeetone, which, from its pitch and its relation of depth to this (ehowing), and its relation of strike and depth to that, (showing,) I take to be the eame plane which hounds the ore in that direction. At a point FF—no, FF, at a point 15, if I know the map rightly, is also an upper surface of limeetone, which I take to be the lowest manifeetation of the hanging country or hanging wall, irregular though it be. Down this incline, (showing,) over the lead, appears also limestone, elightly impregnated with blocks of ore, but, nevertheleee, a country limeetone, and the dovelopments which have been run into the Tiptop, ont in thie direction, (showing,) through firet the Richmond, into the Tiptop, and out in thet direction, prove that that is the country rock, and that there are no masses of ore of any consequence above that point. Bsnsath what I callsd the foot-wall the shaft hes gone down on an incline of 250 or 300 fset undsrneath the foot-wall altogether in country limestone, and run out on a drift through country limestone, proving that et those points there are no importent or considerable stringere or outlyere of ore in that direction. The evidsnce, at I havs said, of fissuring is in the snrface of these walls, which do not absolutely follow the planes of stratification, and possess physical differences from thoss planee of stratification in the cross of fissures which make thsmselves apparsnt at the end of the workinga in this direction, (showing,) end at the end of this ore chember—at the edge of this ore chambsr hsrs, (ahowing,) whsrs

The Limestone of the Country Rock,

With also linss of fracture and fisauring, hound the deposits at those points.

Q. Now name those points where it is houndsd hy that? A. At this ore chambsr hensath the point of winze No. 5, and also at a point not on this map, where a long incline runs up or ahout the Lookout line. So fer as the surveyors have gone, they consider it to he just about on the Lookout line. I ses every structural evidence that the origin of this opening, or hollow in the rock, was hy a fissurs. I hslieve thet the ascending currents of minerelized hot weter from which this thing emanated, in passing upward throngh these fissures, owing to the soluhility—the ready soluhility of the limestone, has hers and there often very grsatly enlarged the original fissure, opening the great cavern which has bsen suhsequently filled hy ors. The whols history of the

Study of Mineral Deposits

Approaching this at all in charecter, show that they have proceeded from a deep-seated lahoratory. The minsrels of which they are composed, the mineral continuations, the chemioal combinations in which they are formed, cannot have heen made sxcspt by the successive introduction of minsralizing liqnids and gesses. The preaencs of gold, ths prssence of arsenic, the presence of eulphydric acid, which has mineralized the galena, taken together, indioate the regular succeaaion of chemical ohengee which have gone on eccording to the hest authoritiee in chemico-geology in all veins. The peculiarities, I contend of this particular deposit, are wholly to be accounted for hy the special condition of the conntry rock. Veins in general, that is I mean

True Veins,

Mey he said to he the result of the forces of fissuring from a deep source, and, eecond, of the emanation of chemical materiale from that deep and heated source. They differ from each other widely ae to appearancee, widely as to chemical hietory, and widely ae to ehape and form. Those veins which ere in the solid granite, and in a large family of gneiee and cuptalline echist rocks, preaent the phenomena of an ordinery tabuler vein. Those veins, on the contrary, owing their origin to similar forces, but created in different conntry rock—thoee that are found in the volcenic rocks, the porphyries of Mexico, the porphylite of Hungary, and the porphyries of Washoe, are immese irregular veins, owing to peculiaritiea of the texture of the rock, and the tendency to conchoidal fracturea, forming elliptical chambers which those volcanic rocks posseas. There is a third claas of veins, thoae where the identical forces have acted on eoft, sugary rocke, rocks which from their mineralogical and lithological structure, have a tendency when met hy a given force to ahatter in every direction. That clase of stones are the limestonee and the dolomites of this world, and the eame forces have acted on these dolomites and limeatones in their metamorphic conditiona. The reaults have heen immenee irregular fractures of very great diversity of form, and a coneequent irregularity and difficulty of following the ore depoeit itself. I contend that the sole difference hetween the three classes of veine is, that of the country rock upon which the fisauring force has acted, and through which the deep-seated chemistry has done its work. I also lay down this proposition: that given the deep-seated fissure, and given the deep-eeated chemical action, the form has nothing to do with its nature as a vein, and that the amplitude or irregularity of chambere is in no way—in no way militatee against the theory of its heing a vein. I pronounce this to he a vein.

Mr. Wren—Q. Where is the top or apex of that lode? A. The apex of anything is ite top, and the apex, as I nnderstand it, of a mineral vein, ie its outcrop, if it has one, and if it has not, the highest point on any given section to which the vein matter rises. In thia case, having a very definite outcrop, I should say that unqueetionably the apex of the hody was there.

PROFANITY never did any man the least good. No man is the richer, or happier, or wiser for it. It commends no one to any society. It is disgnsting to the refined, abominable to the good, insulting to those with whom you associate, degrading to the mind, unprofitable, needless, and injurious to society.

NONE are so seldom found alone, and are so soon tired of their company, as those coxoombs who are on the best terms with themselves.—*Lacon*

The San Francisco Mint.

The annnal "olean-up" of the Mint in this city was completed June 30th. The Mint haa hesn closed for several wseka past for this purpose. The Coiner's statsment is as follows for the fiscal year :

	Ouncee.	Value.
Gold Bullion worked.....	1,547,938.61	$30,659,322.97
Legal Waetage on eame...	2,042.48	37,664.84
Actual Waetage.....	48.58	903.35
Silver Bulion worked.....	183,265.94	213,436.73
Legal Waetage on eame....	284.54	331.00
Actual Waetage.....	1.41	1.64

Ths following teble shows the legal waetage allowsd on bullion manipulated hy the coiner, as well as the actual wastage during the past four fiscal years:

GOLD BULLION.

Fiecal. Year.	Legal Waetage. Ouncee.	Value.	Actual Waetage. Ouncee.	Value.
1869-70.....	2,731.91	$50,826.25	19,26	$358.45
1870-71.....	2,682.28	49,902 88	47.02	874.79
1871-72.....	2,601.14	48,393.30	51.43	956.83
1872-73.....	2,024.48	37,664.84	48,58	903.35

SILVER BULLION.

1869-70.....	1,707.55	$1,986.96	44.39	$51.67
1870-71.....	2,414.03	3,017.53	52.94	78,66
1871-72.....	3,246.15	4,057.69	173.34	216.68
1872-73.....	284.54	331,00	1.41	1.64

In speaking of the efficiency of the Coiner, Mr. Harmstead, the *Bulletin* says: If we take the eight previoua annual ssttlements, and divide them into two parts, and compere the aggregate of these two periods of four ysara eech, with ths opsrations of the outgoing Coiner, we have the following sxhibit:

GOLD MANIPULATED.

Three Settlements ending with	Gold Bullion. Worked.	Legal. Wastage.	Actual. Waetage.
June 30, 1866, ounce..	7,507,611.95	11,261.38	615.04
August 14, 1869.....	5,970,112.60	8,355.14	1,207.14
June 30, 1873.....	5,991,498.92	10,039.81	165.29

SILVER MANIPULLATED.

Three Settlements ending with	Silver Bullion. Worked.	Legal Wastage.	Actual. Waetage.
June 30, 1866, ounces..	2,898,725.47	5,777.49	302.25
August 14, 1869.....	3,133,890.08	6,267.75	352,38
June 30, 1873.....	3,867,126.89	7,652 27	282.08

The first column shows the quantitiss of hullion which heve passed through the handa of the respective coinere; the eecond oolumn gives the amount of waetage ellowed hy the Government in the manipuletion of thie bullion into coin, while the dast column shows how much wes neceeeeerily lost in the procese. While all the coiners heve come largely within the legel limits, the officer in charge for the last four years haa made decidedly the best record in thie reepect. The value of his legal wastage on gold bullion ie $186,787, while the value of his actuel waetage is only $3,093. On silver hullion, the value of the legal wastage allowed him ie $9,393, and his actual wastage is leas than $349.

The atetement of J. P. Cochran, Smelter and Refiner of the Mint for the fiscal year, ending June 30th, 1873, is as follows:

GOLD MELTED.

Gold Bullion operated on during the year, in standard ouncee.....	2,058,679.59
Value of the Gold worked.....	$38,301,015.29
Legal limit of Waetage, etandard ouncee	3,582.95
Actual Wastage.....	232,43
Value of Legal Waetage.....	$56,659.53
Value of Actual Waetage.....	$4,324.37

SILVER MELTED.

Silver Bullion operated on during the year, in standard ounces.....	286,900,99
Value of Silver worked.....	$333,848.42
Legal limit of Waetage, etandard ounces	524.71
Value of Legal Wastage.....	$610.57
Excess of Silver delivered in settlement above am't ch'g'd limit, etandard oze.	1,214 .50
Value of excee.....	$1,554.56

RECAPITULATION.

Value of Legal Waetage on Gold.....	$66,659.53
Value of Legal Wastage on Silver.....	610.57
Total value of Wastage.....	$67,270.10
Value of actual Waetage on Gold $4,324.37	
From this deduct value of Silver excess..... 1,554.56	
And we have as the actual loee to Government.....	$2,769.81
Showing within the Legal loee the eum of	$64,500.29

The Mint opened on the 1st inst. under the charge of O. H. Lagrange, Superintendent; J. M. Eckfeldt, Melter and Refiner; and J. T. Bahcock, Coiner.

The following report of the San Francisco Assaying and Refining Works for June haa been published:

Unparted Gold Bullion received in exchange from the Mint of the United States by San Francisco Aeeaying and Refining Worke during June, 1873:

	Ounces.	Value.
Gold.....	11,019.44	$205,057.23

Refined Gold and Silver deposited in United States Mint during June, 1873, by San Francisco Assaying and Refining Worke:

	Ounces.	Value.
Gold.....	98,793.29	$2,026,028.06
Silver.....	32,575.10	$41,054.75
Gold deposited in Mine.....	98,793.29	$2,026,028.06
Gold eold in market.....	6,999.90	143,760.41
Total Product of Refinery.....	105,793.19	$2,169,788.47

Of the above fine eilver $40,000 wae deposited for Trade Nollare. As compared with June last year the result ie ae follows eent to Mint:

	Gold. Ounces.	Value.	Silver Ouncee.	Value.
1872.....	85,680.04	$1,756,840.77	1,580.15	$2,116.25
1873.....	98,793.29	2,026,028.06	32,575.10	41,054.75

TO ENLARGE.—Pending the result of the hig Cerro Gordo mining euit are the proposed enlargement and exteneive improvemente of the Belshaw & Beaudry furnaces. For some time they have heen preparing to more than double their producing capacity, hy means of more powerful blowers and cupolas of three timee the eize of those now in use. It ia to be hoped that the euit will not long delay these operations.—*Inyo Independent.*

DEWEY & CO.,

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

The best, speediest, and surest method for you to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thousands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for our home inventors, but with the influence of our carefully read and extensively circulated journals, we are enabled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, besides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain Patent,

A well-constructed model is generally first needed, if the invention can well be thus illustrated. It must not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address upon it.

Send the model (by express or other reliable conveyance), plainly addressed, to "DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made up, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will be sent straightway to the Patent Office at Washington.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must be furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specification and other papers should be made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

Address DEWEY & CO.,

CALIFORNIA INVENTION.

CALL AND EXAMINE.

For Sewing Machines, Dentists' and Jewelers' Lathes.

This Invention can be applied to the operating of all kinds of Sewing Machines, Dentists' and Jewelers' Lathes. Its simplicity is only equaled by its durability; it avoids the use of the treadle, which is ungraceful and injurious.

Application made by the Agents for the Pacific Coast.

SAWYER & WHEDON,
1v6eowbp 633 Washington street San Francisco.

AXLE GREASE.

To Millmen, Teamsters and Others.

Your attention is called to the very superior AXLE GREASE manufactured by us for over 18 years.

Recent improvements in the chemical arrangement of the lubricants used in its manufacture render its use as serviceable on the lightest buggy as on the heaviest team.

The extensive demand for the **H. & L. Axle Grease** has enabled the proprietors to reduce its price to as low a rate as any of the inferior compounds, which are continually being forced upon the market.

See that the trade-mark (**H. & L.**) is on the red cover of the package, and take no other.

HUCKS & LAMBERT,

Manufacturers & Sole Proprietors,
SAN FRANCISCO.

Factory.....145 Natoma Street.
Depot.....312 Jackson Street.

A CARD.

The subscriber offers his services to the public for the examination of mines and mining properties. This State abounds in quartz mining properties, which are present failures from the want of knowledge in their development or management. Witness Nevada, El Dorado, Tuolumne and Mariposa counties; witness also Amador county with its Potosi, Seaton, Hazard, Plymouth, El Dorado, Original Amador, Herbertville, Union, Mahonsy, Summit and other gold mining properties, all of which are intrinsically first-class mines, yet all of the above and others in that county are present failures.

But their successful development depends upon Geology, Orology, Topography, a knowledge of "the Chemistry of Rocks and their relations to mines and mining," an apprehension of Nature's great plan of their development; in short, the mathematics of mining.

In the above respect, the subscriber believes himself thoroughly master of the situation. Consultation free.

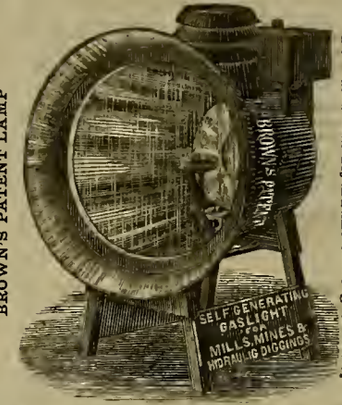
BROWN'S PATENT LAMP.

BROWN'S PATENT LAMP



For Mills and Hydraulic Mining Claims.

One of these Lamps, when placed at a distance of 200 feet from the bank, will light up a bank surface 250 feet in length and 150 feet high, and to a much better advantage than any other light heretofore tried, and at an expense not to exceed five cents per hour. Lamps furnished at short notice.

Letter of Recommendation.

MR. C. B. BROWN—SIR: Your Patent Lamp for lighting hydraulic mines, which you sold to me in December last, has given entire satisfaction, and far exceeds my expectations, and I think it the best and cheapest light ever used to light mining claims by night, and am satisfied that I have saved three hundred dollars by the use of it in the last mining season over pitch or any other light of the same brilliancy; and I will also say that if I could not get another lamp, five hundred dollars would not buy it. Yours,

W. D. APLIN.

Little York, Nov. 5, 1872.

For further particulars, address,
fe22-tf C. B. BROWN, Placerville, Cal.

P. J. PHILLIPS & CO., No. 608 Clay street, near Montgomery, San Francisco, are agents for Brown's Lamp, where it may be seen.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,
MINING,
And BLASTING
POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosives now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other compound now in use.

A circular containing a full description of this Powder can be obtained on application to our Office.

(Continued from Page 21.)

1300-ft level, and the station is opened for a drift north into the level.

ARIZONA AND UTAH.—The main shaft of the Arizona and Utah is down 350 ft. and an incline is being sunk on the ledge in the main east tunnel, which is passing through quartz, with occasional spots of good ore.

GLOBE.—Arrangements have been made to prospect the Globe mine through the Arizona and Utah.

NEVADA.—The new shaft of the Nevada mine is progressing well, 6 ft. being added to its depth last week. The rock is hard, but works well.

BALTIC CONS.—The tunnel of the Baltic Cons. is going ahead well, and yesterday some pieces of ore were found assaying from $18 to $25 per ton. Another shift of men will be put to work next Monday.

TYLER.—The Tyler shaft, 150 ft. deep, is having the water pumped out of it, and next Monday sinking will be resumed for the ledge.

CROWN POINT EX.—The sinking of the large new working shafts of the Crown Point Extension and the Lower Comstock progresses at a very energetic and satisfactory rate.

LADY WASHINGTON.—The hoisting works of the Lady Washington are nearly completed, building and all. The same may be said of the Daney.

GREEN.—The old shaft of the Green mine is cleared out and retimbered down to the incline, which shows signs of having caved to some little extent. As soon as this can be cleared out and retimbered, drifting for the ledge will be commenced at once.

PICTOU.—The main tunnel of the Pictou is being driven ahead with characteristic energy.

JACOB LITTLE.—Good ore in the second crosscut, which assays from $50 to $350 per ton.

YELLOW JACKET.—Drifting both north and south at the 1400-ft., and 1500-ft. levels, develops only excellent indications as yet.

FRANKLIN.—Are making about 5 ft. per day in the main drift, and are thought to be very near the ledge.

VULTURE.—The main shaft is down 30 ft. The whole shaft is now quartz, in which occur frequent bunches of ore of a very high grade. The general prospect for soon striking a body of solid ore is extremely encouraging. Sinking is progressing rapidly.

ALADDIN.—Now down 134 ft., and still sinking. There is no change to note at this time. The prospects continue good.

PORTLAND.—The connection between the new shaft and the old works, perfected some two weeks ago at a depth of 200 ft. having ventilated the mine thoroughly, work is now progressing rapidly. Working 17 men, and much larger amounts of ore from the stopes than ever before.

THE WASHINGTON AND CREOLE MINE.—Shipped last Monday, $5,955.97, and will ship the coming week about $7,500. The bullion produced for the last three weeks has been steadily increasing, and from present indications the percentage of increase seems likely to continue. The results of two hars melted and assayed yielded respectively 1300 and 1399 ozs., of which $448.10 was gold—a percentage of over 12½ of gold in the bullion product. &c.

Arizona.

YAVAPAI COUNTY.

Arizona *Miner*, June 21: Prospecting in Walnut Grove District is being carried on with very promising results, and indications show that this will soon become a very extensive mining district. There is always an abundance of water.

WAR EAGLE.—Jackson & Co. have got down to within 5 ft. of good pay ore in this mine, and their reduction-works are grinding out and saving considerable gold.

CORNUCOPIA.—The developments in this mine how as large deposit of very rich decomposed ore.

Idaho.

RED WARRIOR.—Idaho *Statesman*, June 28: On Tuesday last, Hon. John McNally concluded the crushing of some thirty tons of ore, which yielded about $963. Yesterday he made a clean-up, from 22 7-2000 tons of Wide West ore, with the following result: 128 4-16 ounces of gold; coin value, $1,775.50, which would be at the rate of $81.50 in coin per ton. He has about 100 tons more of ore to crush for himself and others, at Red Warrior, which he will keep pounding away at until it is reduced, that is very rich, and is estimated will yield from $6,000 to $10,000, and there is plenty more of the same kind to be had.

The Pittsburgh and Idaho G. M. Co. have about surmounted all the obstacles in the way of their hoisting works, and will now soon be taking out ore from their mine, the Ida Ellmore. Hon. A. E. Huffaker has been appointed foreman of this mine.

Capt. G. F. Settle & Co. made their first clean-up yesterday, of some 90 tons of ore from the Vishun. It is believed they will have between $4.000 and $5,000, and that there is $10,000.

W. P. Callahan, Esq., in connection with his brother, and Mr. Stephen William, have commenced to crush on some 40 or 50 tons of ore, taken from the Eureka, that is very rich and will pay over $100 to the ton.

Montana.

NOTES.—Deer Lodge City *Independent*, June 21st, says: The old Harris mine, in Jefferson gulch is being worked with plenty water and will clean up a large amount of dust during the season.

Claims in California gulch are paying $20 per day to the hand, with plenty of ore ahead.

American gulch is being worked by McConnell & Co., and are making large clean-ups.

Seaton & Co., at the mouth of Washington gulch have 7 ft. of pay gravel, and all the water they can use; ground pays well and plenty of it to work. Farther up the gulch, Brown & Co. and Buggin & Co. are doing well. Joe Parmantel, next above, is ground-sluicing; pay on bed rock is unusually good.

Highland gulch is being worked by 3 companies with flumes with good prospects of success.

Oregon.

THE OCHOCO MINES.—State *Journal*, June 28: The latest and most reliable information we have from this new mining camp is not very encouraging. Mr. George Milligan, well known in this county, writes to his friends not to be in a hurry in starting for the mines. He has been to the new camp, and thinks the prospect is not very flattering.

Utah.

CITY CREEK MINES.—Salt Lake *Journal*, June 28: The late discoveries made in City Creek Canon are extending further than was at first anticipated. A new discovery, and one of importance is that made by Messrs Houtz and Sirine, two days ago near the mouth of North Mill Creek Canon. He is now in town purchasing provisions and material to send up to the new location, and work will be commenced upon it right away. The same character of ore as that found in the City Creek mines—galena—is found to exist in abundance at the mouth of North Mill Creek Canon, and a rush of miners to that section is now taking place.

The iron mine, near the site of Modoc city, owned by N. P. Woods, is being worked steadily, and yesterday ton tons of ore were taken out and placed on the dump. The last assay showed 66 per cent. of iron, but the ore now being taken out is much better, and will show a much greater percentage of iron.

Mr. Reamer has located another claim within 150 ft. of the mine above mentioned, and its development will commence immediately. The indications show a vein of rich galena.

Prospecting in this camp is attended with more trouble than elsewhere, owing to the thick brush through which prospectors have to sometimes cut their way, and the search for claims has to be conducted with much difficulty. Still the work goes on, and prospectors from the city are daily reinforcing those already in the canon.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Angels Quartz Mining Company---Principal place of business, 408 California street, San Francisco. Location of works: Angels Mining District, Calaveras County, California.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 35), levied March 4th, 1873, the several amounts set opposite the names of the respective shareholders as follows:

San Francisco Gold and Silver Plating Works, 655 Mission street, San Francisco.

2v25-3m E. G. DENNISTON, Proprietor.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

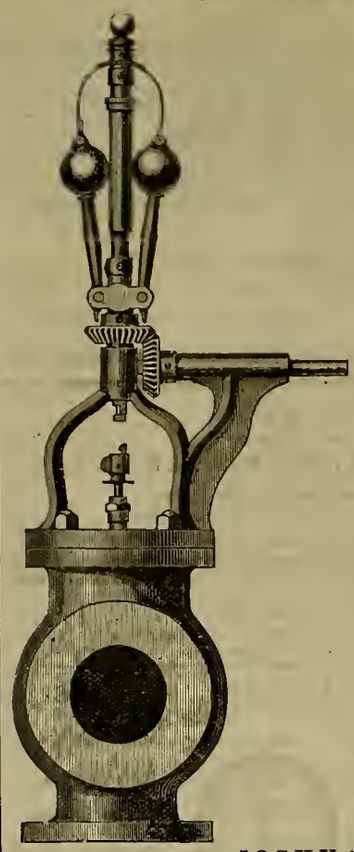
HENDY'S

IMPROVED STEAM ENGINE REGULATOR.

OVER 400 HAVE BEEN PUT IN USE.



RECOMMENDATION.

St. Patrick Mill, Placer Co., Feb. 10, 1873.

JOSHUA HENDY, ESQ., San Francisco:

Dear Sir: We, the undersigned, take pleasure in giving you the following testimonial as to the merits of the Hendy Governor, which we ordered from you about four months ago. Though more than pleased with its workings at first, we deferred writing until we had tested it thoroughly.

Our engine is 12x36 (carrying 70 lbs. of steam), driving 15 stamps, 725 lbs. each; 1 Wheeler Pan, 1 Knox Pan, 6 Hendy Concentrators. The discarded Governor was the common "Arm and Ball Governor;" it giving but poor satisfaction, we decided to try the "HENDY," and are pleased to report in its favor for the following reasons:

1st. It Saves us Fuel. Previous to attaching your Governor we were burning 3¼ cords of wood per 24 hours. We now consume but 2½ cords doing the same work.

2d. For Safety. The "trip" saved us from an expensive smash up but a few days ago, during the temporary absence of our engineer. The Governor belt ran off the Pulleys. Your little automatic trip worked like a charm, and but one or two revolutions was the result, and no damage. Had we been using any other Governor, the probability is that we would not have had a whole cam in the mill.

3d. It is a Perfect Governor. We can turn off the Wheeler Pan and hang up one-third of our stamp, without any perceptible change in speed.

4th. The Adjustment for regulating the speed without increasing or reducing the size of our Governor pulley, is admirable, and as easily managed as setting a clock.

5th. It is Simple and not liable to get out of order, or requiring more than ordinary care.

Yours respectfully,

JAS. H. CROSSMAN, Supt.

GEO. H. BARNEY, Chief Eng'r.

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A..... .....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.

Meetings and Elections.

AUBURN GOLD MINING CO.—July 2d. Directors: Geo. W. Beaver, (President.) J. R. Nickersen, Peter Santer, Jas. Bee, L. M. Foulke, R. Wegener, (Sec'y,) John Manson, (Supt.)

PIONEERS ELECTION.—The annual election of the Society of California Pioneers came off on the 7th inst. Less than 300 votes were cast, resulting in the election of the entire regular ticket, as follows: President, Jas. Lick; Vice-Presidents—David J. Staples, Peter Dean, John H. Jewett, Benj. P. Kooser, J. Ross Browne; Secretary, Louis R. Lull; Treasurer, Howard Havens; Marshall, William Hucfner; Directors — Thomas Nelson, Emil B. Buffandeau, William C. Randolph, C.A.C. Duisinberg, Jacob Deeth, James Neal, Arch. Wason, Henry H. Ellis, Washington Bartlett.

NEWARK M. Co., July 8.—Trustees; S. Heydenfeldt. Jesse Wall, F. W. Clute, A. P. Minear and J. N. Vimont; C W. Watson, Superintendent, and D. T. Bagley, Secretary.

BANK OF CALIFORNIA.—At the monthly meeting of the Directors of the Bank of California, held on the 8th inst., W. C. Ralston was elected President, in place of D. O. Mills, resigned, and Thomas Brown, Cashier. Mr. Mills retains his seat as a member of the Board of Directors. The newly-elected officers are to assume their duties on the 15th inst. The usual monthly dividend of one per cent.—$50,000—was declared, payable on the 15th.

THE DIVIDEND of the Crown Point mine, this month, is $4 per share, amounting to $400,000; last month it was $10 per share, or $1,000,000.

ROCK ISLAND M. Co., July 9.—Trustees: A. K. P. Harmon, W. B. Thornburgh, Joseph Clark, J. E. de la Montague and John Skae.

EL DORADO SOUTH CONS. M. Co., July 9.—Trustees: A. H. Rutherford, J. A. Pritchard, A. J. Bryant, Henry Epstein, Edward Vollmer, Henry Mayers and A. Goldsmith. Since March, 1873, the mine has produced bullion valued at $212,000.

PRODUCE EXCHANGE.—President, Horace Davis; Vice President, E. G. Mathews; Treasurer, E. Ransom. Directors; D. Ballard, P. A. Campbell, T. H. Hammer, Adam Beetb, Wilford Page and H. C. Somers.

New Incorporations.

The following named company has filed its certificate of incorporation in the Secretary of State's office, Sacramento.

THE AUBURN, EL DORADO AND FOREST HILL TURNPIKE ROAD COMPANY, July 7. Object, the construction and maintenance of a toll road from Auburn Station, Placer County, to Engles toll road. Capital stock, $20,000. Trustees—Lenis Bulens, Q. D. Pratt, Robert Leslie, Michael Hohman, B. R. Wells, Sec'y.

HONOR TO THE VETERANS.—Honor also to the inventors whose genius has emancipated the race of women from the drudgery of the needle. Honor above all to a firm which, like the Wilson Sewing Machine Company, distributes its machines broadcast throughout the land, at prices that even the poor and humble can afford to pay. Salesroom, at 337 Kearny st., San Francisco, and in all other cities on the Pacific coast. The company want agents in country towns. *

IN TOWN.—L. P. McCarty, Esq., corresponding agent of the MINING AND SCIENTIFIC PRESS, and Dewey & Co.'s general traveling agent, paid us a visit on Friday last. This gentleman's reputation as a canvasser is first-class. We have never met with any one who understood the business better, and never expect to.—*Calaveras Citizen, San Andreas.*

To Capitalists and Hydraulic Miners.

PATENT SELF-CLEANING SLUICE.

This new and useful invention is designed to collect all the gold as fast as it is set free from the dissolving earth, and conduct it into a receptacle of mercury or safety pocket, under lock and key, from whence it may be removed in a few moments, without either checking the flow of water or interfering in the least with the washing.

The invention, if properly placed in our rivers, will also collect the gold which is yearly traveling down their channels, thus affording an annual income with a trifling expense for attending.

HEALD'S BUSINESS COLLEGE
BRYANT & STRATTON
24 POST ST. SAN FRANCISCO
IRON NERVE EDUCATION GOOD INSTRUCTION
OPEN TO ALL SEND FOR CIRCULARS

The object of this school is to impart a thorough education in business affairs. It is open to persons of both sexes and of all ages. There is an English Department for those not sufficiently advanced for the Business Course. Sessions continue day and evening throughout the year. Students can enter at any time. All wishing to be successful should secure a practical education at this College. Send for "Heald's College Journal," and learn full particulars. Sent free to all by addressing E. P. HEALD, Pres. Business College, San Francisco, Cal. 2v27-1y

Second-Hand Engines and Boilers

For Sale by McAFEE, SPIERS & CO., Boiler Makers, etc., 309 to 315 Howard St.

15-HORSE POWER PORTABLE THRESHING ENGINE—Nearly new made by Wood & Mann. Cylinder 9 inches diameter, 12-inch stroke. Boiler large and well proportioned, has all the mountings, is mounted on wheels, in first-rate condition, and will be sold cheap. This is the very thing for opening a new or working a small mine. Price, $1,350.

30-HORSE POWER LOCOMOTIVE OR FIRE BOX BOILER—made of the best S. H. No. 1 American iron, 5-16 inch thick. Furnace 4 feet long, shell 42 inches diameter, contains 46 tubes 3x12 inches, with grate bars, breeching and smoke stack, all in good condition. Price, $750.

THREE 35-HORSE POWER BOILERS, each 50 inches diameter, 15 feet long, containing 42 tubes 3½ inches diameter. These boilers have been entirely rebuilt, and are in thoroughly good condition. Will be sold together, or separately, at a low price.

15-HORSE POWER BOILER—32 inches diameter, 12 feet long, containing 32 tubes 2½ inches diameter, with steam drum, furnace front, grates and all fittings. Price, $300.

Build all kinds of Boilers, Water Pipe, Pump Column, Buckets, Tanks, etc. jy12-1m

The New Wilson SEWING MACHINE

Has points of superiority over all others. A reliable warranty is given with each machine for

FIVE YEARS.

It is uncqualed for light and heavy work. Examine and compare it with the highest priced machine in the market.

At the lowest Market Prices.

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.

IMPORTANT TO
Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO.,
Little Cottonwood, Utah,
Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 113 and 115 Pine St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 19, 1873.

VOLUME XXVII. Number 3.

Concentrating Ores--The Utsch Automatic Jig.

In our issne of July 5th we made some remarks on the importance of the coucentration of ores, and gave an illustration of Wren's ore concentrator, a newly invented machine for accomplishing the object referred to. We now illustrate the Utsch Automatie Jig, a device highly spoken of where it has heen used. It was fully described in a paper read hefore the American Institute of Mining Engineers at Philadelphia, hy Henry Engelmaun, E. M., and subsequently published in the *Engineering and Mining Journal*, from which source we gather the facts ooncerning it.

Ths Utsch jig was inveuted aud first put iu operation in Germany, then simultaneously patented and introdnced in England and the Continental States, in Australia and America. It was first adopted in the United States hy the Matthiessen and Hegeler Zinc Co., at Lasalle, Ill. There it performed the work of sorti ng the peculiar ore of that locality into no less thau *five* distinct divisions of material, consisting mainly of: (*a*) gangne and non-metallic waste; (*b*) grains consisting of gangue, with calamine or blende attached, which are crushed finer; (c) zine-hlende and calamine for the zinc furnaces; (*d*) grains of zinc ore with particles of galena attachsd, which are crushed finer; (*e*) pure lead ore; working up from 20 tons of rich, to 55 tons of poor raw material for 10 hours work per jig.

The principle upon which the self-regulating discharge of this jig is founded, is that of mutually halanced columns of minerals of uniform specifio weight iu each colnmn, and different specific weights in the different columns. Each column discharges the surplns, whenever an aecnmulation of the material composing it increases its height. A column of galena of sp. gr. 7.5 and 3 inches high, exercises the same pressuro as a column of hlende, sp. gr. 4 and 5.62 inches high. They halauce each other. The height of the water in each partition, and other minor conditions, enter into calculation. The different minerals being confined to their respective compartments, by the constrnction of the machine, the discharge will he mathematically accurate, whether individual minerals he preseut in greater or lese qnantity, or even ahesnt altogether.

The distinctive character of the machine, it will he obssrved, rests on this automatic discharge arrangement, the jig proper differing in no essential from the common pluuger jig; and it is on thie that its value depende. Ae proved hy the actual working at Lasalle, the jig is capahle of separatiug materials varying in epecific gravity never eo slightly, into any required number of divisious; and this, too, without the intervention of skilled attentiou. With regard to this latter point, Mr. Engelmann saye:

"It performe a great amount of work entirely automatically, without the least intervention of mannal lahor, surveillance or regulating, requiring no attendance for weeks aud monthe, after having once been adjusted for an ore composed of a certain variety of minerals, although these may occur at different times, in ever eo varyiug relative proportions. It then works unremittingly, performing its task in the best possible manner, uever missing. When the motive power stops it rests also, and resumes work without the least dieturbance when the power ie again thrown in gear. The relative quantity of the differeut minerals in the ore may change ever so much, one or more of them may he almost wanting for days together, still the machine will work on as hefore, with equally good results, like an intelligent being. All that is necessary is to supply it with food, with crushed ore, and to take away the finished product whioh it has discharged in cars or hins. The machine thns enables the operator to dispense with all manual labor, with its expsnse and uncertainty. There is no need of watching inexperienced or nnreliahle laborers, no shirking, irregularitiea, negligence or strikes, no holidays or pay days."

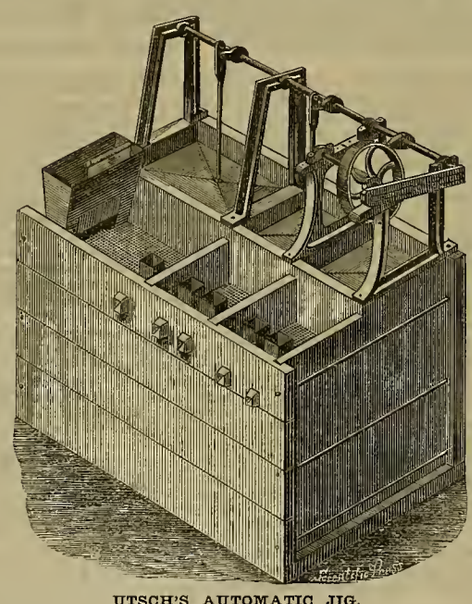
That his iudorsement ia well founded, is shown by the general adoption and ready appreciation the new invention has met with, in so short a time from its first iutroduetion. There are, however, only three of them in use on this coast, as far as we know, two iu Nevada, and one in Idaho.

A New Type-Setting Machine.

Type-setting machines are devices which overy newspaper proprietor and publisher is desirous of seeing perfected, and which every "typo" is not. A machine on a new principle has recently heen brought before the puhlic, etyled Wescott's Type-Making and Settiug Machine. It caete and sets its owu type at the same instant, taking it ae molten metal from a tank and leaving it a new and perfect type in the stick, as if placed there by a compositor. The type is not thrown back into the casee or distributed in any mannsr, and this expeuse is eaved. It is simply remelted. On one end of the machine is a tank heated by gas, containing molten type metal. Parallel with the tank are two rowe of steol frames, each containing the matrix of a letter. Running between these steel frames is a traveler. In front of the tank, containing the molten type metal, is a heavy mould. Connected with the steel framee containing the matrices, hy eimple levers, is a key hoard, precisely like that of a piano, with the names of each letter marked ou the keys. When the key, *A*, is touched, then the matrix, *A*, ie pushed three inches out of line, and the traveler then takes it to the monld in front of the tank containing the molten type metal.

The mould then closes on it, and at the same instant the pump in the tank throwe a jet of the molten type metal which strikee the matrix full in the face. The mould then opeus and the traveler retiros with tho matrix, *A*, ready for the next letter. While this is going on, the type passes hetween revolviug cutters and perfectly formed is pushed on the composing stick exactly as if it had been placed there by the fingers of a printer. This action is repeated with succeeding letters, according to copy, at the rate of 40 letters or more a minute, according to the expertuess of the operator.

The circular issued by the New York Type and Electrotype Company, 88 John street, New York, describing the invention, states that the machine saves the following items: The wbole cos t of new type; the whole cost of distributing type; two-thirds of cost of composition. The machine can he arranged simply for making type by throwing out one lever, when it hecomes self-acting, and will make any designated letter all day at the rate of 80 letters per minute. One great advantage in a machine of this kind is, that all old type and type metal can he used over and over again in making new type. The regular price of these machines, as etated in the circular, is $5,500 with a discount to purchasers of five machiues and upwards. If all that is claimed for this machine in the matter of time and economy provee correct, it will be very generally introduced, especially in country newspaper offices.



UTSCH'S AUTOMATIC JIG.

The Utah Silver Lead Co., paid all its expenses last month and deposited $2,000 in the hank besides. They expect to pay dividends within 60 days. Their sales of ore last mouth were 600 tons, with an average of 60 per cent. lead and $23 in silver and $5 in gold. They will soon commence concentrating and it is expected that the oree will then bring $40 on the epot, or about $25 per ton profit; they can easily sell 800 tons per month.

The North Star mine, Grass Valley, ie doing considerable "dead work," and only 366 tons of ore were reduced last month. It turned out $14,508, and the expenses were $26,500.

The Newark Mill will shortly resume operations; new machinery and an Aikin furnace will be added.

Elmore's Mill in Robinson District, Nevada, will shortly be in operation.

An Invention Wanted.

In our issue of Feh. 22d last, we puhlished an item under this head, stating that an appliance was badly wanted, by means of which a telegraphio operator can communicate with, or signal a train at any place on the route. We have had several letters on the subject, and a correspondent asks us this week what such signals would he used for, whether for the accommodatious of more trains npon a siugle track to prevent collisions, or to notify engineers of danger ahead while ruuning, when there is a train approaching from an opposite direction, etc. Our correspondent asks us to state the needs of railroad men in this matter, as far as we know.

Any system that would fulfill the requirements desired, would not only benefit railroad men, but the general pnblic. It has frequently occurred that two trains have left different stations abont the same time, rnnning towards each other on a single liue of track, without either knowing the other was coming. This was the case in the instance which elicited our remarks ou the subject some time since, for the fact that two trains were running towards each other was known at Elko before the collision occurred. A locomotive and wrecking-car were dispatched immediately, in anticipation of the accident. If any contrivance had heen in vogue which would have warned the engineer of one or hoth trains to slow np to avoid impending danger, the accident would not have occurred. The thing required is some system, which would operate cheaply and he constructed in such a mauner that a train may be signalled at any peint on the line of road. In such a case, if the trains should chance to be running towards each other, a mere danger-signal wbich would infallibly attract the notice of some specified person on the train, would suffice. Some one suggested to us not long since the project of laying a wire betweeu the tracks from station to station, and having an iron rod and a wire hrush on its lower end pass down from the rear car so that the hrnsh shonld pase over the wire continuouely. An instrument in the car would indicate any eignal sent by the telegraph operator at either end. The pereon suggesting thie device admitted, however, that it would be necessary to have the "lightning go after the brakeman with a club" to make it snccessful; moreover, the friction would wear ont the brush very rapidly aud the system would be expensive. The advantages of any mechanism which would cause an electric signal to give warning to a runniug train are plain to all, and eome of our ingenious inventore would make money hy overcoming the difficultiea.

The Water Supply of Virginia City is getting quite low. A two-horse wagon-load of over 450 gallons retails at $3. In Gold Hill teams are hauling it from American Flat, and it sells for $1 per harrel. It would be rough on the iuhabitants in warm weather to be short of water for domestic purposee. They don't drink much of it, up there, however; and it ie not so bad as if the beer supply was low. The *Enterprise* says the mining interests must euffer a little, as, owing to its foaming in the hoilers, the engineere are afraid to use lager-beer. The Carson river ie quite low, but the Eureka mill, the largest on the river, is yet rnnning to its full capacity. The water company will snpply the city with all it needs within a few weeks at farthest.

CORRESPONDENCE.

Notes of Travel in Eureka County, Nevada.

[By our Traveling Correspondent.]

Eureka.

Sincs my visit to this placs ons ysar ago, Eureka has become ths county ssat of a new county, bsaring the sams name as that cut off of Lander County by an act of the last Legislaturs. It is to-day one of the busisst mining camps of Eastern Nsvada. Ths district comprising Eureka contains abont four thoussnd sonls, and its location is about 85 milss south of Palisads, on the C. P. R. R., or about 658 milss east of San Francisco, and is situatsd at an elsvation of 6,651 fset abovs tids watsr. This place contains 5 hotels and some 35 msrcantile sstablishmsnts. Daily and tri-weekly linss of stagss ply bstwesn hsre and Hamilton, and Palisads, also to Elko and Austin. The fars from San Francisco to this place is $58 and the tims required to make ths trip is 48 hours. A little of ths sarly history of the place may not bs uninteresting at this time. Ths

Discovery of the District

Was some tims in Ssptembsr, 1864, whsn soms prospectors came in from Austiu, which is situatsd 70 miles west from hers. Thsy adoptsd laws to govsrn the district, and a Mr. Tannahill was elects ths first Miuing Recorder. These prospectors discovered some carbonats ores, and mads ssveral locations; hut in the "finds" thsre was nothing of a high grade sxcept some pockets, nsvsrtheless, thess humble miners succsedsd in intsresting a New York Company, and one small furnacs was putup, in ths summer of 1866, the remains of which are still visibls. They met with little succsss however, having not only a poor furnace to contend with at that tims, but being very distant from their base of supplies. This occurred before ths C. P. R. R. was completed. From this time on, until the ths great sxcitsment of

White Pine,

In the summsr of 1869, which brought the miners and prospectors again through ths district, but little is known.

In 1866, however, Alonzo Monros cams, and located some mines, on what is now known as "Mineral Hill." Finding some good ores, Mr. Monros wsnt ovsr to Austin in the summsr of 1868, and interested Mr. Stetefeldt, of that place, with him in ths ersction of ths first blast furnace ever built here. Iu March, 1869, the first run with this furnacs was made; it proved, however, a failure; for after running about 2,800 lbs of bullion, this pionesr furnace froze up. Attempts to run it proved unsuccessful, until Msjor McCoy cams over from Whits Pine, bringing with him two Cornishmen, named Jones and Williams. These gsntlemen remodeled Monroe & Stetefeldt's furnace, adding more tuyeres, and finally made the first successful run of a furnace in the district. About that time the

Champion & Buckeye

Mines, (which now constitute the "Eureka Con. M. Co.") were secured by the second pioneer who entered the district, Mr. David Buell, who bonded the said mines some time in Novembsr, 1869, and ssnt Mr. Isaac Bateman to England, to dispose of ths same. He interested some Euglish capitalists in the enterprise, and they sent out eugineers to look into it, who reported favorably. Those furnishing the capital, however, were not satisfied, but had some experts from California to make a report, which was adverse, and the sale fell through. As it subsequently proved, they lost a valuabls purchase. Mr. Buell, undauntsd by his failure, appealed to San Francisco capital, when the prssent "Eureka Con. M. Co." was incorporated, the history of which is too familiar to bear repetition—except the dsvelopment, which I propose to give you in a future communicatiou, together with notes on many other prominent mines in this district. I will however add a little of the early history of an adjoining district, known as the

Secret Canon,

Which is located about 7½ miles south-east of Eureka, and was discovered by H. A. Hogdon Esq, in August, 1869, and before Mr. Buell created any excitement at Eurska; Mr. Hogdon had extracted and shippsd (on mules, by psck train,) several tons of ore to different mills at Austin, in the Reese River district. and Shermantown in White Pine district. The mine from which he extracted this ore is named after himself and known as ths

Hogdon Mine,

The pioneer or discovery mine of ths district, and the one which created the first great excitement, which brought so many prospectors to Eureka district and vicinity in the fall of 1869. Quits an amount of ore of high grade was extracted near the surface of this mine, and, as above stated, worked at mills located in Austin and at Shermantown. There has beeu but little or uo work done on this mine for the last two ysars, until the preseut season. This miue was iucorporated iu December last as the Hogdon Mill and Mining Company, with Elliott J. Moore as Presidout, John M. Moore as Ssc'rstary, and H. A. Hogdon as Superintsndsnt.

The Present Development

Consists of a vertical shaft, 50 feet desp, from ths bottom of which an incline is run some forty feet deeper, exposing a mstaliferons stratum, with strsaks of ors of a high grade, indicating a body of ore close at hand. This corporation claims one thousand fset in thsir location, 300 feet of which are as fine croppings as I ever saw. I neglected to state that for ths first twenty fest in this company's shaft they found fine ors; but wishing to dsvelop it at a greater depth, they ars not sxtracting ors, but sinking, working night and day-shifts. A subsequent location, known as the Geddes & Bertrand, is about 500 feet south of ths Hogdon; and about one mils northerly ars located ths

Basey Mines,

Belonging to an English Company. They ars situated on a highsr range of hills; havs fine prospscts; and I lsarn that they will shortly stsrt a large force of msn to work them. Mors from Eurska District in my next. L. P. MO.

The Vienna Exposition.

[By our Special Correspondent—GUIDO KUSTEL.]

The American departmsnt in the Industrial Palacs, although not quite ready, was opsned to ths public on ths 10th of Juns. Entering the west portsl and turning to ths right, ons finds himself in ths American gallery, and is sure to hsar ths orgaus of the Mason & Hamlin Organ Company befors he has tims to sse anything. The first that attract the attention of ths visitor ars ths excellent

Photographic Pictures

In front and to the right, of Leon Van Loo, of Cincinnati; Schwind & Krueger, Nsw York; Kurtz, Nsw York; also chromo-lithographic picturss of Duval & Hunter, from Philadelphia, etc. Ssvsral cases of gold psns, especially that of Morton, of New York, are worth notics. Near these, on the wall, hangs a large, bsautiful gold frame, in which a very rich collection of bank-notes is tastefully arranged. Some show high amounts, up to $10,000. Among them, photographic portraits of Presidents and other celebrated Amsricans ars placed. The many differsntly-colored postage stamps, systsmatically placed by themselves, also make a nice picture. This very interesting piece is exhibited by ths "National Bank-Nots Company," Wall street, N. Y. Of

Musical Inslruments

Thsre are the celebrated organs of Mason, Hamlin & Co, and of Estey & Co., of Vermont. Ths only pianos are from Steck, N. Y., and one from Hinzen, Rosen & Co., Louisville, Ky. A few elegant zithers are also exhibited. In a glass cass, visibls from all sides, hangs a violin, the "Emperor violin," made by George Gemundcr, N. Y., prics $10,000. Ths ten thousand dollars ssem to create more attraction than the violin itsslf. Soms think it is a Yankee trick, but Mr. Gsmunder writes that the violin is constructed on a certain principle which gives clsarness to the tone, by which it is made equal to the bsst old Italian violins.

Frankliu, Uptou & Co., of Baltimore, exhibit first-rate leather, tanned by this vacuum procsss. The sams article is also exhibited by Shayer Brothers, Boston. Several cases show neatly-made gaitsrs, fit for a delicate lady's foot, not like the Euglish, with such unnaturally-high insteps that they look as if they were made for crippled feet. Also boots and shoes of Bostou maks, of fins quality, ars observed. Cabinet soaps, psrfumes, *eau de Mississippi*, drugs, candles and sugar-coated pills, tastsfully arranged, contribute to improve our exposition. Prsssrved fruits, vsgetables, mackerel and lobsters are also represented. J. Mathew's soda-water machines are evsrywhere—iron ones, of a monstrous size—others really elegant, suitabls for a parlor. Thsrs ars many exhibitors of

Wines

And sparkling wines from California; Busna Vista, Eberhart & Lachman, and Landsberger. Others ars from Cincinuati, St. Louis, Sandusky and New York. The Frsuch took thsir wines away from the Exposition *rayon* and it is said they intend to submit them to the jury entirsly independently of others. They don't like comparative judgmsnt. Eberhardt & Lachman's wines came here by way of Panama in perfect order, wines and California Champagne clear as crystal.

A nics assortment of natural and refined oils is exhibited by Peass; starch from Ohio, a nice case of gloves, N. Y., leather and wooden trunks, Hall's magic curtain fixtures, patent flexible shirts from New York; also shirts from Philadelphia, etc. Several beautiful assortmeuts of fancy cassimeres from New England and Massachusetts are exhibited. Mr. S. White, of Philadelphia, shows a grand display of deutists' articles; single teeth of all sorts and sets without number, splendid tools, a chair that admits of any required position, etc. Clocks of fine work from New York, globes, a model of a counterpoise gun-carriage ars also amongst the other articles. The Smith & Wesson, Remingtou, Colt, Sharp, Peabody and Springfield rifles aud rsvolvers are well represented.

Yosemite Valley Views,

Of large size, are plenty and very excellent; but, of the thousands of spectators, only a few know that it is in California, the majority know not whethsr it means Tahsiti or Hawaii. There is also a splendid photographic visw of ths interior of the Lick House, S. F. Thess two lettsrs ars so fine that ons hardly psrceives them, and then only ons out of tsn knows what thsy mean. The photographers probably think if they know whsre they tqok ths visw it is all right.

Mines and Minerals.

To ths left of the west portal is ths continuation of ths American exhibition. The first group is poorly reprssented, especially in silvsr minsrals. Thoss from Utah are ths most prominent, ths spscimens (copper ore included) are of a proper size, well arranged, sach provided with a printed label showing the value psr ton, ths mine and mining district. Thers is a case of rare minerals from Califoruia, Nevads and Arizona, and a small collection of Arizons gold and silvsr ores. That is all, in respect to gold and silver ores. From Pennsylvania, cobalt and nicksl orss, with bars of the relative mstals, alloys and some mstallic salts (as sulphate of nickel, etc.) are sxhibitsd, also some galena; then a fsw iron ors and coal collection. Ths Sutro Tunnsl Co. ssnt a very intsresting and instructive

Model of the Comstock Mine,

In connection with ths Tunnsl, in ssctions or cross-cuts, by which the intsrior of ths ledge and the direction of the Tunnel ars clearly sxplainsd.

In the middls of the gsllery is a nics structurs of balss of cotton, from Mobile, Ala.; on top of ths balss sugar cane, and on the sides all around, silk cocoons, silk, etc. Yestsrday, to my astonishmsnt, I found out that all thos cocoons and ths silk exposition do not bslong to Alabama, but to California, and were ssnt by I. Nswman This exposition was used without labsls to make a better show of the Alabama cotton bales. I will try to havs it changsd, or, at least, to attach Mr. Newman's printed labsls to all of his articles. Some modsls are also sxhibitsd hers, one repressnting a revolving roasting, or, perhaps, revolving puddling furnacs; whoever exposed it knows what it is. Another repressnts a patent deck suspension truss, of 245½ feet span, of a bridge over ths Ohio River at Louisville, Ky. Thers also are beautiful photographic viswa in this department. Abovs the Utah minerals are views of Salt Lake City, the large organ in ths Tabernacls and soms mining views. Th. Houssworth, of San Francisco, exhibits Yosemite Vallsy viswa, etc. Nsxt comss the departmsnt of

American "Means of Education,"

Which might be tsrmsd, just as well, a "school library." Besides books, thers are soms views and plans of school-houses; a nics large model of ths "Franklin school-houss;" a few sohool bsnches or ssats; writings and drawings of students, and so forth. But of physical instrumsnts, models of machinery, architecture, discriptive geometry; anatomical prsparations; collections of bestles, butterflies and other insects, injuring plants or being in close connection with branches of industry—nothing is exposed save a few physical instruments. As a "means of slsmentary sducation" this department is most intsresting. A day or two since, the "rural school house" was opened. Minister Jay was present. The school-room contains eight rows of chairs, six in each row. The walls are decoratsd with large maps, pictures of botany and zoölogy: on the cathedsr table and benches are exhibited the different primary books, geographical and others. Mr. Jackson Schultz delivered a short speech complimenting Mr. Jay for his servicss rsndered in behalf of the exposition, to which Mr. Jay responded. Professor Hoyt also delivered a longer speech, saying that he was prepared to give all possibls explanation that might be required, etc. In absence of little childrsn, the old childreu performed the "*obligato* singing" before and after ths opening ceremonies.

I remained a long while in the school-room for the purpose of listening to the remarks of the different visitors. The isolated seats and the very well planned geographies and other school-books exhibited on the tables have been much praised by visitors of all nations. Everything was closely examinsd, sven Hall's curtains; the ladies espscially took much interest in ths whole arrangement.

The covered yard adjoining the gallery is not yst rsady. Thers are quite a number of different sewing-machines, but in clossd partitions as yet. Several machines in the American department of the machinsry hall are in motion. From the 2d of June to the 8th, 178 cars came in with articles for the Exposition, ths most from Francs and Switzerland, but also from Hungary, England, Italy, Egypt and China.

The wsather of the beginning of Juns is not much better than it was in May, still, the attendance at the Exposion improved considerably. J. K..

Visnna, June 12, 1873.

CLEAN UP.—The Grass Valley *Union* says: The Idaho continues in its great prosperity. Last week a six days' run with thirty-five stamps gave a clean up of $26,000. This clean up was mads from ths amalgamators, the batteries not being touched. The month's run of ths mill will closs this week, and the first Monday in nsxt month declariug the usual dividend will be in order.

THE nsw hoisting works of ths Raymond & Ely mine ars nearly completed.

City Creek Mines.

The latest dsvelopment of minsrals in City Creek Cañon and the country contiguous to it, says ths *Tribune*, bids fair to create some excitement in mining circles; ths discoveriss so far all bsing within a radius of ten miles of Salt Laks City, and some of them, if ws ars to bslisve ths accounts brought to us, being of a character to produce more or less of a furore.

We undsrstand that up to the present writing ovsr twenty locations have been made of mines containing galsna and carbonats orss of averags richness. and we have hsard the opinion exprsssd that the character of ths formation is such as to justify the highest expectations of the richness, extsnt and psrmanency of the dsposits.

Ths existencs of galena and iron minss situated within ten milss of this city, and approachable at all seasons of the yaar, and to which, if necessary, a railroad can be built with but little trouble, is calculated to havs a wondsrful effect on ths business intersts of the city, and our hopo is that the fullest expsctations of those now sngaged in dsveloping this new rsgion may bs realized.

Having discovered several good ledges, and demonstratsd ths sxistence of galsna and carbonats orss, we trust that the work of prospscting will bs carried on vigorously during the summer months, so that whatever mines may bs discovsred can be thoroughly worked ths coming winter.

When so much of our prospsrity depends on increasing our ore products, thereby adding to our rsvsnue, discoveries like those announced on City Creek ought to be a source of gratification to svsry business man in ths city. Without bsing too enthusiastic ovsr the reports brought to us, thsrs is still snough to warrant the statsment that City Creek mines *may* bs our next sxcitemsnt.

The Sierra Madra Tunnel.

This work, rsosntly commencsd by an English Company, with an original capital of $5,000,000, says ths Colorado *Herald*, is being steadily pushed forward into the mountains by Col. Heaton, President and Superintendent. This scheme is csrtainly the grandest and most extensive private enterprise sver inaugurated in ths tunnel or perhaps any othsr lins, and seems almost too stupendous an undertaking for completion. The plan is to drivs a tunnel 20 fest wide by 12 high from a point on North Clsar Cresk nsarly two miles bslow Black Hawk, through the heart of the main Rocky Mountain Range into Middle Park, a distance of twelvs miles, cutting ths various mines that lis in its course, and to construct and opsrate a railroad in the sams. The tunnel will pass through Bob Tail and Gregory Hills, pass bsneath Central City, and through the Gunnel Hill. At the latter point a branch tunnel will divsrge and pass undsr Nevada aud Quartz Hills, while the main work will continue direct to Middle Park. The above hills and locations, with their numberless rich and exhaustless gold bsaring lodes, will be penetrated at a depth of from 1,200 to 2,400 fest below the surface. The mouth of the tunnel, where work is now going on, is some 7,000 feet above sea level, or nearly 2,000 feet above Denver, and the Middle Park sntrance of the work will bs nearly 8,000 fset above tide water. The main range through which this huge bore will pass, has an elevation of from 12,000 to 14,000 feet. Before ths preesnt capital of the Company is exhausted, which will not be for over two years, the Bob Tail, Gregory, and other neighboring mines will bs cut, after which time it is expected that the profits of the enterprise will be sufficient to ensure its completion. At all events, should the Company havs reasonable success, ws belisve they will drivs the work to points through Quartz and Gunnel Hills, which will include the best of the mining sections of the line projected as far as known.

IMMENSELY RICH GRAVEL.—We learn that ths old Mullins & Ryan tnnnsl, below the Junction, has finally been run through to gravel, and that nnprecedentedly large prospects are obtained. As ths channel has but just besn reachsd we are unabls to state its width. The gravel prospects as high as fifteen dollars to the pan. There is a little episods connected with the history of the mine that aptly illustrates the uucertainty of mining ventures: Mr. Mullins, one of the original locators of the claim, worked for years running the tunnel—which is about 800 feet in bedrock hard as adamant—but become involved and was obliged to give up the mine before reaching gravel. Broken down in health by the severe labor he had performsd, and driven by necessity to seek employment, Mullins went to work in ths tunnel for wages, ths new proprietor having concluded to run it ahead. He had been at work only about three weeks when he struck through into the channel, developing the rich gravel mentioned above. Who can imagine the feelings of Mullins, who, after laboring for years, was forced to relinquish work when a hard earned fortuns was within his grasp? Such outrageous fortune as that is enough to drive a mau to hard drink, but it is by no means an uucommou incident among those who woo the fickle goddess with the pick and drill.—*Calaveras Chronicle.*

THE first week's run of the St. John quicksilver mine, completed this week, resulted in the filling of fifty flasks of quicksilver, valued at $3,825. The furnace used is a nsw invention.

SCIENTIFIC PROGRESS.

Position of the Planets for July.

The Observatory of Vassar College furnishes the *Scientific American* with a monthly statement of the position of the planets. We condense the following for July:

MERCURY rises on the 1st of July at 6h. 18m. A. M., and sets at 9 P. M.

VENUS was at its greatest brilliancy on the 10th of June, at which time it was easily seen at noonday, and a glass of low power showed it as a beautiful crescent. In the first half of July, it will pass the meridian a little before nine in the morning, rising on the 1st at about 2 in the morning, and setting at near 4 P. M.

MARS rises on the 1st at 30 minutes after noon, and sets a little after 4 in the morning. On the 31st it rises at 1h. 10m. P. M., and sets at 11 P. M. Mars is easily known by its ruddy light, and can be seen in the southwest after twilight. But little can be seen of its peculiarities with a small telescope, although a powerful one will show very decided markings on its disk.

JUPITER is still conspicuous in the evening sky among the stars of Leo. On the 1st of July it rises at 8h. 39m., and sets at 10h. 12m. It is much less favorably situated for observation than in the winter, and very few of the phenomena of its satellites are visible in this locality for the whole month.

SATURN is more favorably situated for observation, but is so far south that it does not reach, when on the meridian, an altitude of much more than 27°. It will be best seen at midnight on the 22d of July, rising on the 1st at 8h. 48m. P. M., and setting at 6h. 14m. the next morning.

URANUS is still very unfavorably situated for observation, rising in the morning and setting at 9 P. M. on the 1st of July.

NEPTUNE rises between 12 and 1 A. M. on the 1st of July, and sets a little before 2 P. M.

METEORS AND SUN SPOTS.—Meteors were frequent on May 1st, but have thus far (June 18th) been rare in this month. It has also been a very remarkable period for the absence of sun spots. No spot could be found on the sun's surface (glass of low power being used) from June 13th to June 17th. On June 18th a very small one was perceived.

NEW PLANETS DISCOVERED IN 1872.—Since the beginning of last year, twelve small planets have been discovered, as follows:

Peitho, discovered at Bilk, by R. Luther, March 15.

A not yet named planet, discovered at Ann Arbor, Mich., by Watson, April 3.

Lachesis, discovered at Marseilles, by Borelly, April 10.

A not yet named planet, discovered at Ann Arbor, by Watson, May 12.

Gerda, *Brunhilda* and *Alcestis*, discovered at Clinton, N. Y., by C. H. F. Peters, the two first on July 31, and the last on August 23.

A not yet named planet, discovered at Paris, by Prosper Henry, September 11, and two others, at the same observatory, by Paul Henry, November 5.

A not yet known planet, at Ann Arbor, by Watson, November 25, and another at Clinton, N. Y., by C. H. F. Peters, on February 5, 1873.

PROPER COMBINATIONS IN SOAPS.—According to Mignot, a perfect soap is one in which the fatty matters and the alkaline have been so thoroughly combined as to leave no excess of either component; a desideratum which is very seldom reached, as the soap is either too alkaline, in which case it parches and dries up the skin, or it is too fat, and thus makes the skin greasy, so that the dust readily adheres to it. The former inconvenience is the more serious of the two, as it very soon leaves its impression upon the skin. For this reason soapmakers are in the habit of employing an excess of fat, notwithstanding the inconvenience mentioned. Mignot now informs us that silica introduced into the soap, in the form of infusorial earth, will tend to neutralize any excess of the alkaline elements of the soap, as it is soluble both in soda and in potash, and it will, at the same time, take up the surplus matter by absorbing it, and combining with it to a certain extent. Infusorial earth, as is well known, occurs in different parts of the world in great quantity, and immense deposits are known in various portions of the United States, especially in Idaho, Nevada and California. It is the same substance as that now so extensively employed as a polishing powder under the name of electro-silicon.

GOVERNMENT AID TO SCIENCE.—Government has wisely responded to the urgent solicitations of engineers and the engineering press throughout the country in appropriating $100,000 for the purpose of continuing the experimental investigations upon steam boiler explosions, commenced by the Franklin Institute in 1835, and very ably extended by Col. Stephens, in the highly instructive experimental explosions during the last year at Sandy Hook. The experiments authorized by this very liberal appropriation will be made in part at Sandy Hook, and in part at Pittsburg or Cincinnati—each being under the charge of a committee of five engineers. The information which may thus be obtained may prove of inestimable public benefit, and we shall look forward to the inauguration of the experiment with great interest.

Hardening of Dried Peas in Boiling.

While some peas become soft in boiling, others become horny and hard, and it has been a question whether this is due to the peas or to the water. Prof. Ritthausen examined two samples of peas, one said to become soft on boiling, and the other hard, and on boiling them in distilled water found these characters substantiated. The analysis of their ashes gave:

	Soft.		Hard.	
Phosphate of lime	10.77	18.91	10.41	26.96
Phosphate of magnesia	8.14		16.55	
Phosphate of potassa	59.74		37.43	
Sulphate of potassa	3.10		14.80	
Chloride of potassium	4.72		6.23	
Potash	....		11.47	
Phosphoric acid	4.43		....	

From this we see that the soft-boiling peas contain a considerably greater amount of phosphate of potassa, a smaller percentage of phosphatic earths, and more phosphoric acid than the other kind, which, for their part, are richer in the earth phosphates, poorer in other phosphoric compounds, and contain an excess of potash.

In the action of water on those peas poor in phosphoric acid, that hardened on boiling, the legumins, which is present in large quantity, although partially combined with the excess of potash, has also its function. It is decomposed, with the separation of a compound of lime or magnesia, which becomes horny on heating and brings about the hardening referred to. Cold water extracts from those peas that boil soft, 4.24 per cent of soluble legumins, while from the hard boiling kinds only 1.73 per cent can be derived. The difference in the amounts of nitrogen and sulphur was so slight, that the hardening could not be ascribed to a larger amount of albumen, or of sulphuric acid. Some kinds of peas, however, represented as hardening on boiling, softened when boiled in distilled water; and analysis of their ashes gave nearly the same results as with those of the other character.

AN INTERESTING CHEMICAL EXPERIMENT.—To prove that the inner, dark portion of an illuminating flame contains combustible gases, the general practice is to insert into that part of the flame a glass tube, so inclined that a portion of these gases shall rise into it, and thereupon igniting them at the farther extremity of the tube, or leading the contents of the tube by an aspirator into a convenient vessel, when its combustibility can then be directly tested. Mr. Heuman has communicated to the German Chemical Society another method, and a simpler one, of accomplishing the result, which seems worthy of notice.

He recommends taking advantage of the well-known fact that a mixture of about 4 parts of chlorate of potassa and 1 part of strontium nitrate, heated to fusion, will burn with a very intense flame in hydrogen or illuminating gas, when once the ignition of the oxygen liberated from this mixture is effected by contact with a flame.

To perform this very pretty experiment, the author states that it is only necessary to fuse a small quantity of the mixture in question in a little spoon at the apex of a luminous gas flame, and then to lower it into the dark portion, when a brilliant combustion will immediately ensue; while, when removed to the luminous portion of the flame, or taken altogether out of it, is is at once extinguished.

AGASSIZ ON DEVELOPMENT.—In the recent series of lectures on embryological development, Prof. Agassiz declared the development theory of Darwin a daring assumption. He maintained that many of the lower animals were introduced under more highly organized forms than they have ever shown since, and have dwindled afterward. The following is one of his more explicit declarations:

I believe that all these correspondences between the different aspects of animal life are the manifestations of mind acting consciously with intention toward one object from beginning to end. This view is in accordance with the working of our minds; it is an indistinctive recognition of a mental power, with which our own is akin, manifesting itself in nature. For this reason more than any other, perhaps, do I hold that this world of ours is not the result of the action of unconscious organic forces, but the work of an intelligent, conscious power.

MAKING HYDROFLUORIC ACID.—Hydrofluoric acid is produced by the action of sulphuric acid on fluor spar in a platinum or lead retort. One of the troubles connected with its production is an extremely hard residuum which is left in the retort, and which cannot be removed without great difficulty. Mr. A. P. Stuart, however, has obviated this disagreeable consequence by employing, instead of fluor spar, a mixture of equal parts of fluor opar and gypsum. The residue left behind in this process may readily be removed by the application of water.

EFFECT OF SUNLIGHT ON FLOUR.—It is maintained that the inferior quality of certain kinds of wheat and rye flour is frequently due to the action of sunlight on the flour; even when in bags or barrels the gluten experiences a change similar to that occasioned by heating in the mill. The tendency thus imparted to it, to become lumpy, and to form dough without toughness, is similar to that of flour from moist grain, or of flour when it is too fresh, or made from grain ground too early, or when adulterated with cheaper barley meal. Such flour can be improved by keeping for some weeks.

EFFECTS OF SULPHUR WATER ON IRON PIPES.—Dr. E. Priwoznik, in *Dingler's Journal*, says: It appears that, when the iron mains conveying the mineral water from a source near Hainburg, Austria, were taken up after having been for more than a dozen years underground, the iron thereof had been strongly acted upon, as exhibited by the diffusions on structures upon the fracture. On being analysed, the author found the interior layer to consist, in 100 parts, of: Hydrated oxide of iron, 81·08; free sulphur, 12·29; sulphuret of iron, 4·48; hygroscopic water, 0·57; nickel, cobalt, magnesia, silica, traces of carbon, and chlorides of ammonium and sodium, 1·58. The second layer was found to contain only 79· per cent of iron, but no sulphuret or excess of carbon was discovered; while the third outmost layer was almost pure cast iron.

EXHALATION OF CARBONIC ACID GAS.—The *Archiv fur Physiologie* contains an account of Aubert and Lange's interesting researches on the quantity of carbonic acid exhaled in a given time from the skin of a man. The experiments were carefully made in an air-tight chamber, in which the subject for experiment was seated, and through which a current of air, freed from carbonic acid, was steadily passing, while the proportion of carbonic acid in the air on leaving the chamber was estimated by transmission through bulbed tubes containing a solution of salt of barium. The results of these novel investigations leads to the general conclusion that sixty-two grains of carbonic acid—a considerable amount, certainly—are exhaled from the body of a full-grown man, through the skin, in the course of twenty-four hours.

REDUCING THE INTENSITY OF A NEGATIVE.—According to Lesalle, a negative can be diminished in intensity by first washing it and then covering it with a solution containing 15 grains of chloride of gold and .53 of a quart of water. The operation is to be repeated until the plate has obtained a proper tone. A quantity of nitric acid is then to be poured on one corner, enough to cover the whole plate, when the silver is immediately dissolved and almost instantly disappears. It is then to be re-enforced with sulphate of iron, and then reappears with a great degree of transparency. Pyrogallic acid may be made use of to bring it up both to the desired degree of intensity and to that of transparency. The image which remains after the application of the nitric acid, on account of its great transparency, is well adapted for taking large pictures.

MECHANICAL PROGRESS.

STEAM AS A FIRE-EXTINGUISHER.—Dr. Weidenbusch, of Wiesbaden highly recommends steam as a fire-extinguisher, and suggests experiments as to the best method of employing it, as well by the use of portable boilers (where the connecting pipes would produce the chief difficulty) as by pipes and boilers arranged for each building. As an illustration of its efficiency, he gives the case of a factory about 196 feet long and 33 feet wide, the garret of which was filled with rags, shavings, leather scraps, &c., in which, when the fire was detected, half the length of the roof was burning. The fire apparatus arrived about an hour afterward, and the extinguishing appliances of the building itself were so defective that the whole roof was in flames and had fallen in, and the lower story was on fire in different places. About 2½ hours after the outbreak of the fire a steam boiler, separated from the building, and not in use for some hours, was fired up with wood, and the cast-iron pipes were cut by a daring carpenter who entered the room of the burning building. The effect was instantaneous. The room, filled with the steam issuing under high pressure, (which, however, he does not consider essential), soon darkened, one portion after another ceased to burn; even the heaps of rags in the garret, with free access of air, were gradually extinguished, and after half an hour all danger was regarded as past. The effect was too marked to be ascribed to the fire-engines operating during the same time, and the firemen were more and more impressed with the fact that their labor was superfluous as the steam came into play.

NEW MECHANICAL MOVEMENTS.—Among the collateral benefits of the competition of the inventors with reference to improvements in canal navigation, is the discovery of two new mechanical movements. One of these is a wheel revolving upon a central universal joint; the other is a telescopic shaft surrounded by a sleeve vibrating upon trunnions. In the practical device, a shaft, driven by two small engines, each 2½ horse-power, with dead points at right angles to each other, extends from the deck of the canal boat to the shore, but being hinged near the engines, is capable of being raised or lowered, as occasion may require. The revolution of the shaft turns a cogged wheel, to whose centre it is attached by the universal joint. The cogs of the wheel fall into those of a permanent track laid on low supporters along the canal bank. The fixed leverage of a rail track is thus obtained without the need of a heavy weight, like that of a locomotive, to procure the necessary adhesion.

INCRUSTATION OF LOCOMOTIVE BOILERS from the use of impure water, even in ordinarily favorable localities, has become so serious and expensive a matter that it has been purposed to construct extensive reservoirs for the collection and storage of rain water, instead of employing wells. When the rainfall is 40 inches, and the passage of 20 locomotives a day is required to do the work of the road, a roof or collecting surface of five acres, would be required at intervals of every five miles; and yet the opinion was expressed, by a committee appointed for such investigation, at the last meeting of the Master Mechanics' Association at Baltimore, that the cost thus incurred would be less than that required for keeping boilers in repair from injury sustained from incrustation. The annual cost of repairs in a locomotive boiler, made necessary by the use of impure water is set down by the committee at $750.

The Committe has no faith in any of the patent devices which are advertised as sure preventatives to incrustation. The only effectual remedy is to use pure water. Some attempts have been made to purify water impregnated with mineral substances before it is allowed to enter the boiler, but the results have been indifferent. They believe that repairs are made necessary and boiler explosions are sometimes occasioned by the incrustations dropping from the over heated plates, and permitting the water to come suddenly in contact with the hot surface, thereby generating immense volumes of steam, which produce the concussion that ruptures the boiler.

MACHINE FOR TESTING THE VALUE OF LUBRICANTS.—Prof. R. H. Thurston, of the Stevens Technological Institute of Hoboken, N. J., has invented and patented a simple device for testing the comparative value of lubricants. It gives the amount of friction, pressure or bearing, and temperature of journal box at any time while in operation, and the readings of the same are to be taken at short intervals during the test. By the testing powers of this device, builders of various descriptions of machinery, may determine and select the peculiar kind of lubricant best suited to the different classes of machinery which they are offering to the public.

Thus sewing machine builders, who require a lubricant of long endurance and small frictional resistance and viscosity, can make a proper selection. So of locomotives, which require a lubricant that will bear high pressure for the greatest length of time without heating, etc. The relative power of lubricants for resisting high temperatures without decomposition, is another important point that may be tested.

The device promises to be one of much value to machine builders and others, in thus enabling them to decide upon the economy and fitness of this quite expensive and very important adjunct to the successful running of machinery. Master mechanics can obtain permission to construct and use the machine, on application to the inventor.

HOT-GILDING OF IRON.—The process of hot-gilding of iron, and similar metals, has been lately much simplified by Kirchmann, who produces gilt designs which are very uniform, and which bear polishing. This is done by rubbing the surface with soda-amalgam (which amalgamates it immediately, even if the surface be oxidized), and then quickly applying a concentrated solution of chloride of gold, and expelling the mercury by the heat of a lamp or furnace. Similar results may be obtained with platinum and silver salts.

NEW PLAN FOR REMOVING SAND BARS.—A method of removing sand bars from rivers, invented and patented by Alfred Garnham, of St. Louis, Mo., consists in anchoring a cable under water, and providing the cable with angular arms, so arranged that the force of the stream will actuate the arms, make them revolve and beat up the sand, which is swept away, as fast as loosened, by the current.

THE ST. GOTHARD TUNNEL.—Active progress is being made upon this important work, about 800 workmen being constantly employed. At the end of March last the tunnel had reached a distance of 806 feet. The work at that time was greatly retarded by the unusual amount of water, which found its way from every direction into the excavation, amounting to about 1,100 gallons per minute.

A STEAM wagon is to run from Nashville to Pulaski, Tenn., commencing regular trips in October next.

A TELESCOPIC COMET is now attracting the attention of astronomers. On the 7th inst. it appeared as a faint nebulous mass, its position being 4 hours 7 minutes right ascension, and 4° 34′ south declination. We are not told whether it will come near enough to be seen with the naked eye. It is to be hoped that the spectroscope may be so brought to bear upon it as to give us some new facts with regard to this singular class of heavenly bodies.

ASPHALTUM deposits abound in the southern portion of this State and the supply is practically inexhaustible. A very large deposit has lately been found near Rincon Point, in Ventura county, which is said to be from six to fifteen feet thick and covered with soil to the depth of eight or ten feet. It is in close proximity to the ocean.

Our Weekly Stock Review.

THURSDAY EVE, July 17, 1873.

Our stock market has been in a deplorable condition most of the past week, the feature, however, being the break in Savage. It was reported that the 1,700-ft. level cross-cuts of that mine were failures, and the Virginia stocks broke with the news, creating a panic, which carried other stocks down also. Savage has been going up since the first of April, but after the books closed, the election was virtually decided and the defeated parties threw their stock on the market.

Dividends this month were as follows:

	Per Share	Amount
Belcher	$ 8	$832,000
Crown Point	4	400,000
Black Bear	50c	15,000
Eureka	1	20,000
Eureka Con	1	20,000
Keystone Con	1	10,000
K. K. Con	25c	12,500
Meadow Valley	1	60,000

On Friday the market evinced no extraordinary activity, and was weaker than on the previous day. On Saturday there was no more animation, and the fluctuations in prices were of no moment.

On Monday it was still weak under the heavy break in Savage. Tuesday Savage again fell heavily, carrying other stocks with it. The market rallied a little in the afternoon, and Baltimore Con. rose $2; Belcher, $3; Hale & Norcross, $2; Ophir $1; Raymond & Ely, $2; Belcher fell $1.50 lower and Crown Point, $2.

On Wednesday a slight advance in prices was apparent, but the fluctuations were small.

The Raymond & Ely passed its dividend again this month, much to the disgust of stockholders. The Crown Point surplus this month is $509,096. The Raymond & Ely dispatch of the 14th says the total shipment up to 14th, for July, amounted to $93,008. The Idaho mine, of Grass Valley, paid a dividend of $77,500 —$25 per share—produce of June run. The Belcher telegram of the 11th says: "South drift, 1,300-ft. level, still in splendid ore, and looks very favorable. South cross-cut, 305 feet south, 1,200-foot level is in twenty feet, and shows fine ore. Our samples, $104." Thus it appears, the 1,200-foot level is also 305 feet in the Belcher and 390 feet in the Crown Point. The *Alta* says:

In the descent of 400 feet from the 9th level the ore has lengthened from 70 to 670 feet, and has widened from a few feet to 120 feet. The 1,400-feet level is now draining in the Crown Point, and three winzes are sinking on it in $100 ore. This level may prove still richer than the others where a portion of the ore has been taken out. The pyramidal shape of the ore seems to continue, and the Jacket mine, on the north, is feeling for it with good indications. The striking it there will at once determine its entire occupation of the Crown Point ground, as well as that of the Kentuck and a portion of the Jacket. It may, on the south, cross the Belcher to the Seg. Belcher, and the present aspect of the works justifies such anticipations. The mines possess the most perfect machinery; but the removal of such quantities of ore requires very careful proceeding in filling in. It is sometimes not prudent to move ore until the substitute for it is quite ready to take its place, and therefore the outturn is occasionally retarded.

There are apprehensions of trouble between the Crown Point and Belcher Companies about some ground. An accurate survey shows that the Belcher Company has worked on the Crown Point ground 3¼ ft. at the 1,000-ft. level; 6 feet at the 1100-ft.; 14 ft. at the 1200-ft. and 18 ft. at the 1300-ft. level. Several thoroughly-competent engineers will act for both companies on a certaining exactly the amount of ground worked over. A suit for reclamation of ore may be instituted, unless amicable arrengements are made. The value of the ground is thought to be worth upwards of half a million dollars. Work upon the ground has been stopped until the matter is decided.

To-day stocks were weak and irregular and a decline is apparent in several descriptions.

AN IMPROVED COOKING RANGE.—A cooking range was patented through the SCIENTIFIC PRESS Patent Agency recently, by James H. Mitchell of this city, which shows some new and important points in construction. The front plate of the stove or range is removable, and the oven are secured to it so that by taking away the front plate, the ovens will also be removed, so that they can be repaired when necessary, without resorting to the present plan of tearing down the range to get at the oven. The top of the range is made in sections, and when one of the sections becomes cracked or broken, it can readily be removed at little expense, whereas as formerly constructed, in a single piece, the whole top has to be renewed when it is cracked in any portion. Mr. Mitchell also claims an arrangement for protecting the water pipe, which is usually carried around inside of the range to furnish hot water. The range also is provided with a permanent shelf arrangement conveniently situated to receive and keep hot, dishes and viands which have been prepared. This range appears to be just the thing for hotels and restaurants, and we learn that the inventor has put up quite a number already, and has orders for many more. Messrs. Locke & Montagne, of this city, have made arrangements with the inventor to manufacture and sell these ranges upon the Pacific Coast.

STEAMBOAT CREEK mines, Douglas County, Oregon, are again being worked. The owners are now busily engaged, making ditches and flumes, and have hopeful prospects.

DANIEL WELLINGTON, of Virginia City, Nevada, is requested to communicate immediately with this office.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

CALAVERAS COUNTY.

RAILROAD FLAT DISTRICT.—Calaveras *Chronicle*, July 12: The Superintendent of the Sanderson is anxiously awaiting the arrival of a new Cornish pump. Ore in bottom of shaft looks and prospects splendidly. A few hands are stoping above the lower north level, extracting ore worth $50 per ton.

Some work is being done on the Prussian Hill with a view to giving certain parties a fair opportunity to investigate its merits.

W. Gambol & Co. are reopening their old mine on the South Fork ridge, some two miles north of Railroad Flat. The mine paid well previously.

WEST POINT DISTRICT.—All late developments in the Lone Star enhance the value of the property.

The shaft of the Atlantic is 75 ft. deep; running levels; ore will probably average 18 inches in thickness, shows gold freely.

Zacatero struck a 20 inch vein in south level; the ore shows gold pretty lively.

The transverse drift of the Ohio has tapped the east vein, 4 ft. thick of fair milling ore. The drift has evidently cut the north end of an extensive and valuable chimney. As the south level of the west vein progresses with its usual width the ore gains in gold.

RICH STRIKE.—Calaveras *Citizen*, July 12: During the week there has been one of the richest quartz discoveries near San Andreas ever made in this county. Francisco Ochoa, a young man who has been living at West Point, came here last week for the purpose of prospecting for quartz in the vicinity of San Andreas. After several days' work he found a small ledge about one mile from town, from which he has taken rock of astonishing richness. He has done no work on it as yet; but it is calculated that some 10 or 15 pounds of rock which he found on the top will yield $800. The ledge is about 1 ft. wide. The proprietors of this treasure are Francis Ochoa, Dr. Oviatt and George ft. Chick.

RICH GRAVEL CLAIM.—Lloyd's claim is now paying better than ever, the last clean-up having exceeded their utmost expectations. The Co. now employ 12 men, and the arastra is kept constantly running. The proprietors sunk considerable money in prospecting the claim, and are now receiving it back with interest. We hope their good luck will continue, and the prospects are very favorable for its doing so.

INYO COUNTY.

Inyo *Independent*, July 12: 'PANAMINT MINES.—We are permitted to extract from a private letter the following items concerning the Panamint district, the mines of which are now creating some little excitement in the southern portion of our county. The district was discovered in January last, by R. C. Jacobs, W. L. Kenneyand R. S. Stewart, the enterprise being projected by Jacobs and Kennedy, when afterwards Stewart went with the party. The number of locations recorded amount to 80 or 90. The class of ore is copper silver glance, or grey copper ore heavily charged with silver bearing sulphurets and chloride. About June 1st galena lodes were discovered by Churen and Wilson; some of them are large, 10, 12 and 15 ft. wide, and some running on the surface for a mile or more. The mines are situated immediately south of Telescope Peak, the Recorder's office being in Surprise Valley, where the principal mines are situated. The rock assays all the way up to $3,000 per ton, but the probable average of metal bearing ore is $125 per ton. Nothing except the Sierra Nevada can beat the location for timber and water. Altitude of mines about 8,000 ft. Country rock, lime.

The silver ore is properly milling rock, but if lead is found in abundance it will be smelted. Distance from Lagunite Post Office (Little Lake), 55 miles; from Los Angeles, 210 miles. The principal lodes found are the Wide West, the Gold Hill, No. 1 and 2, Wonder, Wyoming, Marvel, Pinoe Altos, Surprise, Challenge, Beauty, Chief, Canon, Venus, King of Kayoret, Esperanza, Silver Ridge, Garry Owen, Balloon, Panamint, Mina Verde, Bell Belle, Sunset, Pine Tree and many others. Surprise Canon runs about 50 inches of water under four inch pressure. The mines are all in Inyo county, and distant 100 miles from Independence.

NEVADA COUNTY.

NORTH STAR MINE.—G. V. *Union* July 11: During the past month, the North Star mill reduced 366 tons of quartz taken from the mine. This yielded 2,495 ounces of amalgam, or 820 ounces of gold. This gold is valued at $14,508. The expenses of the mine for the same time amount to about $26,500. It must be remembered, however, that the North Star is doing an immense amount of dead work, which will result, eventually, in causing the balance to go to the other side of the account.

MINING NEAR ALLISON RANCH.—Grass Valley *Union* July 15: The Atlantic Co., consisting of Mr. Colbert and others, are starting work on the Atlantic claims, situated south of Allison Ranch, in Vail's ranch.

The Omaha, near the Ranch, has a ledge which is about two feet in thickness, and shows well in free gold. There are many ledges in the vicinity of Allison Ranch, the most of them located, which will pay for working.

YUBA COUNTY.

SMARTSVILLE MINING CO.—Grass Valley *Union*, July 15: The Enterprise Co., operating at Smartsville, will soon have the great tunnel and flume completed, and be ready for washing rich gravel. The flume is a mile and a quarter long, the greater portion of it being in the tunnel. It is 4 ft. wide and 30 inches deep. It will be paved with stone. The tunnel is 8 ft. high and 7 ft. wide at the bottom. The tunnel has cost something like $100,000. In its construction about $12,000 worth of Giant Powder was used. The work has been in progress about 3 years. When the flume is completed it will require $10,000 worth of quicksilver with which to charge it. The Co. has a great body of gravel, which prospects well from surface to bedrock.

Nevada.

STAR DISTRICT.

DE SOTO MINE.—*Silver State*, June 28: This mine, we are informed, is worked more extensively than any other in the district. It is located on the south side of the canon, in a siliceous limestone formation known as the "Sheba belt," and is traceable on the surface about 3 miles. Two ledges, known as the east and west veins, running parallel with each other, and 100 ft. apart, have been developed in the works. The east vein, at a depth of 300 ft., is from 11 to 14 ft. wide, and in a 50-ft. stope, which is now being worked on the lower level, carries considerable shipping ore, worth at San Francisco $600 per ton. The west lode, which is not being worked at present, is from 1½ to 5 ft. wide, and not so rich as the larger vein. The Co. has let a contract to run the lower level on the east ledge 100 ft. further south.

STAR DISTRICT.—Pioche *Record*, July 11: Mr. Wesley Williams, Star District, Utah, gives us the following items about that locality: The principal ledge in the district is the Hickory. On this ledge a shaft has been sunk to the depth of 135 ft. So far as prospected, the lode shows a body of ore from 4 to 9 ft. wide, of good milling quality, and rich in silver. A ten-stamp mill is now on the way from Chicago, belonging to the company who own the Hickory mine. The Hickory is situated in what is known as North Star—Star district being subdivided into North, South and Middle Star, and West Camp. South Star was the first portion of the district discovered, and contains a great many ledges more or less developed. The ore is generally very rich. In North Star there are also a great number of locations some of them of a very promising character, but the main mine of that section is undoubtedly the Hickory. In Middle and West camp the veins appear to be larger and better defined than elsewhere, and it is not impossible that further developments will prove them to be the main mines of the camp. Lincoln District, five miles from Mineralville, about which there was considerable excitement two years ago, is now untenanted by a solitary miner, though there is no doubt that there are some very valuable mines in the district. Litigation, that curse of mining camps, has had much to do with producing this state of affairs. Mineralville holds its own, and is quite a thriving place.

WASHOE.

KOSSUTH MINE.—*Enterprise*, July 8: The shaft is now down 69 ft. and is in tolerably hard and dry rock. It is divided into three compartments and is being very neatly and substantially timbered. The engine and hoisting machinery is all on the ground and the pit for the engine foundation is dug. It has been excavated in the solid rock and the foundation will therefore be firm. The new shaft is situated about 300 ft. east of the old one, which was sunk to the depth of over 300 ft. The ground from the old shaft down to the new one is literally covered with quartz and quartz boulders. The lead is of immense size. The main lead crops out just west of the old shaft, while a large branch of it comes to the surface west of the new shaft. While the main ledge dips to the east, the large spur we have mentioned appears to stand in a vertical position. The ore found in the ledge prospects exceedingly well, and now that machinery is being erected and preparations made to properly work it, we have no doubt an excellent mine will be developed.

PHELPS' CONSOLIDATED.—This property embraces a lead lying to the east ward of and running parallel with the Kossuth lode, and south of and about in range with the Buckeye and Lewiston mines. The lead was first found and opened upon while the work of constructing one of the tailing reservoirs was in progress, but has since been opened in several other places. It assays well in both silver and gold, and, if properly developed, would prove a valuable claim.

BUCKEYE MINE.—We yesterday called at the Buckeye mine, while on a visit to the various mines now coming into notice about Silver City. Work is being steadily prosecuted, 30 men being employed at the works. They are taking out 25 tons of good milling ore per day, which is reduced at the Hope Mill. They are now down 400 ft., and are taking out ore from 4 different levels. The principal yield of the ore is gold. During our stay at the mine, James Kellen, foreman, took a hornful of dirt from the car and washed it out. The dirt came from the 200-ft. level, and judging from the prospect obtained from that washed, would pay $17 or $18 per ton. The gold is very fine—almost as fine as flour. A good deal of water is coming in at the bottom of the mine, and the pump is kept constantly running.

LEWISTON MINE.—This mine, located and principally owned by Mr. McLaughlin, is situated south of and on a line with the Buckeye and in Long Ravine. Two shafts have been sunk on it. The upper one, or that nearest the Buckeye, is down a depth of 50 ft., all the way on the ledge, which is very well defined, and is here four ft. in width. The ore yields well in both silver and gold. We were shown assays made of ore taken from the vein, which run all the way from $53.66 to over $300 per ton. There is no machinery on the mine, and so much water in the shaft that it is impossible to sink it deeper with a common windlass. The lower shaft is about 30 ft. in depth, and in sinking it the same difficulty with water was experienced.

CROWN POINT.—Gold Hill *News*, July 12th: Owing to the breaking of one of the spur-wheels of the hoisting-engine, during the first of the week, the usual yield of ore has been greatly lessened, comparatively few men being employed in extracting ore. The main south drift on the 1400-ft. level is still driven energetically ahead toward the Belcher line, with no change of interest since our last report. The east crosscut from this drift, to tap and drain the heavy body of water between the 1300-ft. and 1400-ft. levels, is in 68 ft., four drill-holes being in drift and one in the cross-cut, which is easily handled by the pump. As fast as the pressure of the water decreases, another drill-hole is started, so as to keep the supply of water up to the full capacity of the pump. As soon as the water began to disappear from the 1300 foot level, three different winzes were started on that level, one near the north line, another near the center and the other near the Belcher line. The north and middle winze are each down 6 or 10 ft., the entire distance in rich ore. The machinery is again repaired, and the ore-yield will be increased during the coming week to 450 tons of ore per per day.

BELCHER.—Daily yield 450 tons per day, from the ore-producing levels, all of which are still looking finely. The south drift in 289 ft. from the Crown Point line, with the face still in fine ore. The main incline is down 191 ft. below the 1200-ft. level, and the 1300-ft. level station will be opened as soon as the Surveyor gives the proper points to start from. The dividend of $8 per share, declared on the 5th inst., and disbursed day before yesterday, aggregated $832,000.

BALTIMORE CONSOLIDATED.—The heavy body of water at the upper level in the ore-vein shows no sign of decreasing, which may be considered a fair indication that the lower level drift has not yet reached that ore vein, as it would doubtless tap the water. The north drift is still following the ore vein, which shows continued improvement as farther drifted upon. At the lower level the drift west is in clay and quartz, with increase of water. The indications are such as to justify the belief that the ore vein is close by.

CONSOLIDATED VIRGINIA.—Sinking the shaft is making steady, though not quite as good headway as at our last report, owing to the striking of a belt of porphyry of a much harder quality than that heretofore penetrated. The main north drift on the 1,167-ft. level from the Gould & Curry shaft has made no progress during the week on account of the heavy and continuous flow of water from the face, which is all that the new pumps of the Gould & Curry can handle.

JULIA.—The main east drift on the 800-ft level is still driven vigorously ahead, with no change to note. The south drift from the main west crosscut on the 1,000-ft. level tapped a heavy body of water on Thursday last, which has stopped all work in the face at present. The water rose in the shaft a distance of 20 ft., but not so as interfere with the work. The hoisting tanks are now able to drain the supply with ease.

CHOLLAR-POTOSI.—Daily yield 100 tons of ore, the assay value of which is $30 per ton. The ore breaste in the Belvidere, Blue Wing, and other portions of the old workings in the upper mine, are not looking quite so favorable. The east cross-cut from the main northwest drift at the fourth station is in 60 ft., the face in quartz carrying some metal, but showing no rich development as yet. Annual meeting next Monday.

NEW YORK CONSOLIDATED.—Shaft down 260 ft. and making good progress. The pump keeps the shaft entirely clear of water, allowing of the most perfect facility in sinking. From two to two and a half feet per day is the average downward progress made. Mr. Thomas Brooks, the Superintendent, is conducting operations to the very best and most effective advantage.

AMERICAN FLAT.—The drift from the Baltimore shaft, at the 450-ft. level, has crossed within 40 feet of the American Flat line, and is in clay and quartz, with the water increasing. The winze is in porphyry and clay, looking very favorable.

PIOTOU.—The main tunnel is still being energetically driven ahead, with favorable indications coming in at the face.

CROWN POINT EXTENSION.—The large new working shaft of this company is making most excellent progress downward, and will soon require steam hoisting works, the foundations for which are already being graded and prepared. It is a three-compartment shaft, intended to work this mine a great depth, and being located on the north side of the canon just below the Jones residence, it will anticipate the regular eastward dip of the great lode, which it is expected to cut at the depth of 1,000 feet. The location being covered by United States patent, and immediately adjoining the Crown Point and Belcher, is one of considerable importance.

LOWER COMSTOCK.—The sinking of the new working shaft of the mine is being most energetically conducted with excellent progress, the rock working well. As soon as required adequate hoisting works will be erected to carry the shaft to a depth of 1,000 feet or more. The ledge, however, will be cut at a depth of 800 feet. Lying as it does on the branch of the great lode which passes down Gold Canon, between the Silver Hill and Dayton mines, the Lower Comstock is a most valuable mine and will so prove to be one of these days.

OVERMAN.—Good progress is being made westward with the main drift, and branches at the 1,000-ft. level. The machinery and everything works well. The Overman Company are deserving of the most triumphant ultimate success for the great perseverance and energy they have displayed thus far in developing that particular section of the old Comstock.

MINT.—The first cross-cut, seventy-five feet from the shaft in the main southeast drift at the first level, has penetrated the ledge, which, at that point, is ten feet in width, showing some ore of an excellent quality. The second cross-cut, on the same level, is through the vein, which, at that point, is eight feet in width, and of a very promising character.

OCCIDENTAL.—The mill was started up on ore from the mine last Wednesday. A supply of 600 tons of ore is already delivered at the mill ready for reduction. From 30 to 36 tons per day are being extracted, with thousands of tons in sight, which can be extracted as fast as the mill can crush it. The mine never showed better or looked more prosperous than at the present time.

OPHIR.—The main shaft from the 1,475-ft. level, after passing through a hard belt of rock into a soft stratum is now in hard rock again. The north drift at the 1,300-ft. level is also in hard, unfavorable rock. The south drift at that level is in excellent working ground and favorable indications. No change elsewhere.

SAVAGE.—The main south drift on the 1,700-ft. level is still driven energetically ahead to connect with the north drift on the same level, from the Hale & Norcross, with no new developments. Prospecting the other levels still continues, with no change of interest to chronicle.

GOULD & CURRY.—Prospecting the 1,500 and 1,600-ft. levels continues with unabating vigor, and no favorable developments to report. About 10 tons of ore per day are being extracted from the old upper workings. The new pumping machinery works to perfection.

CALEDONIA.—Daily yield 50 tons of ore from the 400 ft. level, keeping the Sapphire mill steadily running. Both the north and south drifts on the ledge, from the main west tunnel on the 500-ft. level, are showing more favorable indications of ore developments than heretofore.

HALE & NORCROSS.—The north winze on the 1,700-ft. level is down 120 ft. in good sinking ground, and no material change of interest to report. Nothing new to report of the other levels of the mine. Sinking the incline for a new level will be resumed in a few days.

SILVER HILL.—The first station continues to yield 60 tons of ore per day, keeping the Bacon mill running steadily. The main north drift at the second station is still driven ahead parallel with the ledge and no change of interest to report.

FRANKLIN.—The main west drift has been cleaned out and repaired to the ledge, and is now in very favorable looking vein matter. It is expected to reach the ore body, known to exist, in a very short time, when some good developments may be looked for.

JACOB LITTLE.—The ore in the lower tunnel continues to show finely as further developed. Some very rich assays are obtained from it. From the second cross-cut, drifting in the ledge shows good ore, assaying well in both gold and silver.

DANEY.—The hoisting works are completed and in full operation, and the sinking of the new shaft is being prosecuted with great energy. From what is known of the ledge at this point, some good paying ore is sure to be developed by this shaft.

YELLOW JACKET.—Drifting as usual, both north and south, at the 1,400 and 1,500-foot levels, with no new developments to report. An assessment of $5 per share is levied.

SIERRA NEVADA.—Daily yield, 50 tons of ore, keeping the mill steadily running. The ore bresats continue to look and yield well the further the vein is followed back into the mountain.

UTAH.—The water was drained, and sinking the shaft resumed on Monday last. The sinking is making excellent progress, the rock in the bottom blasting finely, and the machinery working to perfection.

ARGONAUT AND UTAH.—Sinking the shaft is progressing at the rate of 2 feet per day. The winze in the main east drift on the 250-foot level is down 70 feet, the face still in ore of an excellent quality.

WOODVILLE.—The north ore sections show still further improvement this week. Superintendent Curtis has got the mine in excellent working shape, and is developing it for all it is worth.

KNICKERBOCKER.—The southwest cross-cut from the main west tunnel on the 400-foot level is in 36 feet, the face in quartz, and showing some very favorable and encouraging indications.

GLOBE.—No further work can be done to advantage, by reason of the great heat and bad air, till an engine and blower are put in operation.

BUCKEYE.—Daily yield, 20 tons. The ore-producing sections look well, showing little or no change for better or worse.

Colorado.

ITEMS.—*Herald*, July 2. The liveliest mining district of Gilpin county at present, is between Mountain City and the Bob Tail hill. The Briggs Brothers are raising large quantities of rich ore from the Gregory and Briggs mine. Rogers is mining on the Bobtail through the 1,150 ft. tunnel, recently completed. The Fiske is mined by George Mahee through this same tunnel. Bela Buel is still mining extensively on the Leavitt at Mountain City, and is putting in a sixty-stamp mill. Work has again been resumed on the Bates and Hunter and on the Gregory Second lodes.

Above Central, George Barrett is working the Winnebago and Castro mines, under lease from the Co. The ore pays well.

The lower portion of the Prize lode is being worked by Gilbert. On Quartz hill less mining is being done than at any previous period for several years. Roberts & Co., who pumped the water from the shafts of the Ophir Co.'s property on the Burroughs, one of which is 600 ft. deep, are now working about 40 men, and are raising large quantities of rich ore. J. B. Tomlinson is working number six on the Kent County with profit. Kimber, Fullerton & Mackey are working the Pocahontas near the Illinois. Sparks & Fagan are extensively working the Waterman on the Kansas lode. The quality of ore now raised is not very rich, but prospects are fair for a better condition. The Shanstrom Brothers are raising considerable ore of fair quality from the American Flag. On the hill north of Nevada Topping, Hosse & Co. are working the Hubert successfully.

(Continued on Page 44.)

The Great Valleys of California.

How Shall they be Irrigated?

No country on tbe globe possesses more fruitful or extensive valleys, available for cultivation only by irrigation, than the State of California. The experience of the three or four years past, has showu that a generslˌ liberal and comprehensive system of irrigation is essential to a proper development of these extensive tracts of land—thst by such a system, tbey may soon be fitted to contain, and fnrnish remunerative employment for, a population of two or three millions of people. Without such improvements they will continue for ever tbe ssme arid wastes wbich tbey now present.

The measure of tleir growth and development will depend upon the plan and policy, which may be adopted for tbeir irrigation. If a broad and liberal policy is adopted, fostered, guarded and protected by the State, they will soon teem with millions of happy, thriving people, sufficient in numbers and intelligence to furnisb bread, sugar and textiles for almost the entire Union; and their anuual products may be counted by hundreds of millions of dollars in value, to which the yield of the mines of the entire Pacific Coast will be but a mere bagatelle.

On the other hsnd, if the waters which exist in ample sufficiency for all purposes of irrigation, are placed under tbe control of a few unscrupulous capitalists, they will be doled out at the hightest price which tbe land owners can possible pay and live, by wbich policy a shabby, ill-directed system of cultivation will be introduced, which will lsrgely diminish the numbers that will people these valleys, and greatly reduce their moral, social and physical status.

Which of these two policies shall we adopt? Which will most benefit tbe great masses of the State at large? These questions will probably receive a practical and fiual answer next Winter, at Washington and at Sscramento, and every person in the State is more or less directly interested in securing au issue which sball benefit tbe masses rather than a few apeculators.

The people can briug about such a result only by a determined unity of effort to send to the next Legislature and to Congress men of enlarged and liberal views—men who will have the interest of tbe people at heart, and men who have shown themselves incorruptable. There is probably no question that will come before the next Legislature, or before Congress, in which this State will have so grest an interest as the scttlement of this matter of irrigation. And who doubts that a Legislature, the majority of which shall be made up as our two or three last ones have been, will hesitate to sell itself to the moneyed influence that will present itself for special privileges?

California is at this time a prolific field for speculators. It seems as if men had gone mad over the idea of acquiring lsrge and speedy wesltb, and any measure, however corrupt, which bids fsir to aid in such acquirement seems to find ready supporters.

We have a grand scheme of irrigation for the San Joaquin valley alresdy under way, without any definite plan or purpose of action. They are looking to Congress and our Legislature for aid and encouragment, and they should receive it under proper restrictions and regulstions. There are other similar enterprises on foot for the Sacramento and other valleys throughout tbe interior. No doubt tbere are many, and, perhaps a majority of well meaning, honest men engaged in these various schemes for improvement; but in view of the general spirit of speculation, and the corrnp legislation wbich everywhere ahounds at this time, none can doubt that so prolific and promising a scheme as is here presented will fail to be improved by scheming and designing men, who are already, or may hereafter, become interested in tbese projects. Tbere can be no question as to such an event, unless the people elect men who will refuse to become parties to such conspiracies against the good of the State.

Diversion of Butte Creek to Concow Valley.—The Butte *Record* of yesterday says: The Cberokee and Spring Valley Consolidated Mining Company, on the 5th, commenced to divert the water from Butte Creek, tskiug it to Concow Valley through the discharging arm of the Dogtown pipe. The work just completed was one of great magnitude. Tbe water is piped scross Little Butte below Dogtown, thence along the ridge and over the west branch of Feather river into Concow Valley, thence by a ditch leading along the ridge to a point opposite Cherokee Flat; and thence it is taken in another pipe and conveyed back across the west branch to Cberokee Flat with a pressure of 900 feet. There were used in the work 6,500 feet of 30-inch pipe, and there are eight miles of canal eight feet in width. The capitsl employed iu the constructiou of the stupendous work is about half a million of dollars. It is believed that nesrly all the water of Butte Creek will thus be diverted from its natural channel, and that as a consequence, the stream in the valley will be dry in the summer. The farmers along its course are uneasy at the prospect, and fear that they will be seriously injured. Indeed, we learn that steps will be taken to test the right of tbe Company to divert tbe waters of the creek: the farmers claim tbat they have rigbts in the premises which must be respected. Tbe probability is thst the matter will be in litigation for some time to come, and that there will at least be a feast of fst things growing out of it for lawyers.

The Chinese Temple.

It seems hardly worth while for the Chinese to erect a temple for worship in this city, because almost every Cbinamen puts up a little god on his own hook in his private apartments. Nevertheless there are such things as "Joss Houses" in San Franciseo, and a representation of the interior of one is herewith given, from a drawing by Eastman. It is situated in the Chinese quarter of the city, and presents nothing peculiar in its exterior appearance, with the exception of the tinsel ornaments and Chinese inscriptions at the door. In this temple there are four rooms containing idols; the drawing, however, shows only the main room, wbich has four alcoves and six gods. In the central alcove there are three gods, and hideous looking objects they are, not at all calculated to inspire either confidence or fear in the observer.

CHINESE JOSS HOUSE, SAN FRANCISCO, CAL.

The middle one of these three is *Fun Ten Tin*, the "God of tbe Sombre Heavens," who controls water, and is worshipped to prevent the fires so much dreaded by Chinese in their crowded, wooden buildings. Their deity is a vegetarian, and only vegetables are used as offerings. On the left band is *Kwan Tai*, the "God of War," corresponding to the Mars of the ancients, and possessed of an appropriately red face. This personage is worshipped by the Chinese in this country more than any of their gods, and in temples where there is only one image, it is invariably his. He is also regarded as a god of wealth, and is besought for general benefits, receiving almost universal worship. From this it will be seen that there is "method in their madness," and their action will strike a sympathetic chord in many hearts which worship the same idea in another form. The head on a twenty dollar piece is perhaps handsomer to look upon than that upon a Chinese god, but tastes differ. This god is found more frequently than any other in Chinese shops, stores, and dwellings. He is a great arbiter of disputes and quarrels, and to invoke or threaten his aid is as effective in settling accounts as to begin a law suit. On the right band of *Kwan Tai* is *Nam Hoi Hung Shing Tai*, the "God of the Southern Seas," or local god of Canton, who controls fire. He receives his worship, and offerings of wine, tea, meats and vegetables, from those wbose effects be has preserved from the flames.

The alcoves, or cabinets, in which the gods are enthroned, are made of wood, profusely, but not elegantly, carved, and lavishly gilded. The general darkness of the room is removed by the rich gilding and the gaudy robes of the gods, and an abundance of tinsel, peacock feathers, etc., on the top and at the base of the alcove; and on the fantastically embroidered vestments of the idols may be traced the sinuosities of the dragon, which is itself idolized. Before tbis main cabinet an oil-fed lantern is kept burning, not by "vestal virgins," but by a very unprepossessing Chinese priest. Should the flame expire, they think as did the "College of Virgins," that it betokens dire calamity. In the cabinet on the left is *Wah Taw*, the "God of Medicine," who appropriately holds in one hand a large golden pill; arguing method again, needing no explanation to be appreciated. Before his altar is a table covered with sand, in front of which a priest sometimes stands, after repeating his incantations, till he reaches a clairvoyant state, and then he writes with a stick, under dictation of the Spirit, what is intelligible to no one else, but what he never fails to read and interpret.

The priest or attendant has the care of eleven tin or bamboo canisters, about a foot high and three inches in diameter. These contain bamboo slips, each numbered to correspond with slips of paper containing the answer of the god. After the worshipper bows once or twice, he kneels and shakes the slips till one falls to the floor. This is placed on the censer of incense, where the god can see it, and his approval is sought. If not approved, the process must be repeated until a favorable answer is received. This approval is gained by means of the divining-sticks, the general method of consulting the gods. If the deity is not supposed to know the circumstances of the case, he may know them by the burning of paper, upon which is written the necessary information. On the floor, in front of the images, are vessels to receive the libations. Cooked food is placed before them while the act of worship is going on, but is then carried home and eaten by the judicious worshippers; cups of tea can always be seen before some of the images. The worshipper prostrates himself, either bowing or kneeling three times, and then lets the divining-sticks fall to the floor. These are pieces of wood six or eight inches long and shaped like the half of a split bean If the flat surface of one rests on the ground and that of the other is uppermost, the answer is affirmative and the inquiry ceases. But if both flat surfaces are on the ground the answer is unpropitious, and is repeated to see the result of twice out of three times. With unfavorable continuation, it may be necessary to continue to three times three, or even longer. Should both flat surfaces be upward, the answer is indifferent. When tbe oracle is consulted by the bamboo slips, and the lot is approved in this way, the priest always makes a charge for the slip of paper, thus adding to his support; and this final answer is often as indifferent, equivocal or ambiguous as were those of Dodona or Delphi.

Between the two alcoves already spoken of is a tall stand containing red flags, each having a letter or character upon it. These are the symbols of authority for messengers. Corresponding to this, on the opposite side of the main cabinet, but hidden from view by the large metallic vases and candlesticks on the tables in the middle of the room, is a box with the seals of office. The vases contain artificial flowers and the candles are of Chinese vegetable tallow, sometimes highly colored. The god in the cabinet on the right is *Tsoi Pak Shing Kwun*, the "God of Wealth." He holds in his left hand a bar of bullion, emblematic of his power, which is singularly appropriate on this coast. (Query—If in the Eastern States, would he hold a greenback?) He is the special patron of merchants and all receivers of money, and is worshipped by those desiring aid in their enterprises. In front of all the altars or cabinets, are incense-jars filled with ashes, in which are placed upright pieces of lighted incense, sticks of punk or other material. The worshipper often holds a small bunch of these lighted sticks while he bows or prostrates himself before the god. The bell shown to the left of the engraving is used in arousing the god when he is asleep. It was cast in Cbina.

There are a number of other images in this temple, distinguished by no particular feature but unpronouncable names. Christians are always permitted to visit the temple to whom the attendants are uniformly courteous and polite.

Useful Information.

Insect Life -- Something to Think About.

It is often said by persons when speaking of animals, insects, etc., that they are poor brainless things; yet do they not often display greater sagacity or what is called witchcraft, than man would show by his reason under like circumstances?

"Long ago, it was ascertained by naturalists that worms and insects are without a brain, and yet they pursue a course of activity which bears much upon the domain of reason; so we are accustomed to say that they act from instinct, which is no explanation at all of the phenomena in the higher orders of organic life which have their origin in the brain. If that organ is severely injured, so that its normal functions are no longer performed, consciousness and orderly manifestations of its influence are interrupted or suspended. But the insect world swarms with beings of the most delicate construction, without hearts and without brains, whose movements and habits, independently of thousands of contingencies to which they are exposed, prove in the most satisfactory manner that their acts are a near approach to the elements of a reasoning faculty, if they do not indicate reason itself. When, by accident, a thread of a spider's web is broken, the little weaver examines the misfortune with extreme care, and by taking different positions, surveys the damage, and then proceeds artistically to repair it by splicing or inserting an entire new cord. Again, when a wandering fly becomes entangled in the net, the cautious approach of the owner of the trap, lying patiently near by for game, indicates calculation in regard to the character and strength of the victim. Does it not strangely resemble reason when all its movements, under such an aspect of affairs, show beyond a doubt the spider considers the matter in all its relations before venturing to seize the prey? And yet spiders are without a brain."

Eyes.

There is a wonderful diversity among animals in respect to the number of their eyes. In mammals, birds, reptiles and fishes, they are limited to two, and are always placed on the head. The greater part of the surface of the head of the house-fly is covered by an aggregation of about 10,000 eyes; and in the dragon-fly they number about 50,000, and may be easily seen by the use of a magnifying lens even of very small power.

They are not always confined to the head alone. In spiders and scorpions there are generally eight or ten of them in one or more clusters, on the dorsal aspect of that part of the body which is formed by the union of the head and thorax.

The star-fish or five-fingers, familiar to every one who has spent any time on our sea-coast, has an eye on the tip of each ray or arm. In the sea-urchin, which is homologically nothing but a star fish with the ends of its rays drawn close together, the five eyes are gathered in a circle around what is considered the hinder portion of the body.

The scallop has numerous eyes on the edge of his mantle, extending from one end of the animal to the other, and forming a semi-circle. Some marine worms have them in clusters, not only on the head, but also along each side of the body, even to the tip of the tail, and they are connected individually and directly with the medium nervous cord. If we descend to the lowest forms, we find many infusoria which have neither eyes nor nerves, and yet it is easy to see that they are sensitive to light, for they either seek or avoid it.—*Hours at Home.*

Hearing by the Teeth.—A correspondent of the New York *Observer*, after reading an article on the "Conveyance of Sound," stating, as a fact not generally known, that sound may be transmitted by the teeth, when the ears are closed, almost as distinctly as by the ears when they were open, and wishing to test its accuracy, experimented and wrote to that journal as follows:—"I took the end of a long wooden pole (22 feet long) between my teeth, and requested another person to scratch with a pen-knife at the opposite end, when I distinctly heard the sound of the scratching, though when my teeth were removed from contact with the pole it was quite inaudible.

This, in connection with the following incident, a few years ago, suggested to me the inquiry whether contact with the teeth, or interior of the mouth, as a medium for the communication of sound, might not be resorted to in some cases with advantage in the education of the deaf and dumb. The incident I alluded to is this:

In 1860 I became acquainted with a very sweet deaf and dumb girl, about fifteen years old, who was a great favorite with my daughter, (of nearly the same age), as indeed she was with all who knew her. One day my daughter, her dumb friend and several other young girls, accompanied by the parents of some of the latter, visited Fairmount Water Works, in Philadelphia, and while stopping in the parlor of the hotel there to rest, a gentleman who was with them—the father of one of the girls—called for sherry cobblers for the party, which were served, each tumbler being provided with a glass tube by which to draw the liquid into the mouth. When the tumblers were nearly empty the air, entering with water into the tubes, produced a gurgling sound, when the deaf and dumb girl became greatly excited, laughed vociferously, and springing to her feet, and calling by gesture the attention of her companions, pointed first to her tumbler and then into her ears, and then laughed again, and as soon as she was sufficiently composed, told the other girls in the manual language of the deaf and dumb that she distinctly heard, when finishing her sherry cobbler, the noise of the water passing through the glass tube from the tumbler to her mouth—the first sound that she had ever heard in her life."

Cultivation of Fish in Ditches and Ponds.—Experience proves that fish are much more easily cultivated than has been supposed. Much attention is now being paid in Germany to their cultivation in ponds and ditches, and it has been found, contrary to the generally received opinion in reference to such localities, that they are more favorable for the purpose than other large bodies of water, apparently fresh and pure in their character. This is doubtless owing to the great abundance of animal life, as well as to the more decided concentration of vegetable substances in the form of living plants of different kinds, including the algæ. This produces a constant evolution of oxygen, needed for the respiration of the fish, and allows a larger mass of life to be crowded together in a given space. The reproduction of the species is also unusually rapid, and the young grow very quickly.

Good Health.

Sensations Produced by the Inhalation of Nitrous Oxide Gas.

Many of our readers may possibly feel some interest in learning what are the sensations experienced during the inhalation of nitrous oxide gas, which has come to be extensively used as an anæsthetic. Doubtless, the sensations experienced by any individual will be quite different from those which will be felt by others in the same circumstances, so that the record of one experience would be but little guide. Yet the following description, from the *British Journal of Dental Science*, is so well written, that it may serve to gratify reasonable curiosity of the fortunate people who have never yet been obliged to resort to any of the modern means of allevisting suffering attendant upon severe surgical operations:

I had to undergo a painful operation. I wished to take the nitrous oxide gas. I had administered it a great number of times, and, in hearing the incoherent way in which patients expressed themselves as to the sensations whilst passsing into an anæsthetic state, I hoped I might be able to define, somewhat, the effects of the gas. I say I hoped to be able, for, of course, it is impossible to say what may be the effect of such an action upon any individual, until we have experienced it, as I have no doubt different persons are differently affected, and the gas is so interesting and important to us that everything concerning it is worthy of notice. I was well attended. Two Fellows of the Royal College of Surgeons and the anæsthetist were standing behind me so that I could only see the face of the anæsthetist, as he leaned over my shoulder with the mouthpiece; the other two were quite hidden from me. I am quite sure of that; I was perfectly composed, and as soon as the pipe was put to my face I formed a resolution steadily to take in the gas. My eyes were open and I looked at the distant wall. I heard them say "He takes in the gas freely," which were the last words I heard distinctly; then I felt my eyes droop and close. Now I seemed to be in a different atmosphere, just as we feel in passing into a tropical house at Kew Gardens—different, but not an unpleasant atmosphere. As to choking, we hear so much about, or suffocation, I felt not even the least repugnance. The only effect was, I remember, thinking to myself this is another atmosphere; it seemed sweet and sooty; at the same time, my ears were filled with a hurring sound, such as I suppose is felt in descending in the diving-hell, but not so violent. Immediately there danced before me a violent light the size of a large candle, and with a strange, unearthly motion, and a confused, burring sound, it rose higher and higher, and I seemed to be strangely upborne with it. Up, up we went to a very high altitude; at last the light stood still, the burring ceased, and my attention was simply fixed on the light. It seemed an immense height we had come. To this stage I seemed to be a nonentity; all my care had been devoted to the sound in my ears and the movement of the light; all the unpleasantness of atmosphere had passed away.

Now, however, a change came over me; I became a person—a some one—I felt as though I could see from every part of me—a sort of cataleptic state; and, just as in looking over a cliff at Beechy Head, on a calm day, you hear conversation on the sea below, though you cannot discern the men in the skiff, so now, in a strange, muttering undertone, I heard a voice as though explaining something about *me* to others. I was sure there were others present, and though explaining something, I did not know a single word of what was said, and, gradually, there crept over me the conviction that I was bound helplessly, and that they were doing something to me. There was a dead calm, the mutter ceased; I could see them looking intently, with heads inclined. Simultaneously they raised their heads, and the voice again spoke, but I had no pain, nor had I any pain or feeling when the gash was made; indeed (though I was cut in two places,) not even the slightest prick; still, I knew when the tumor was punctured. Although it was awfully tender to the slightest touch in my normal state, I had not the slightest pain until the tumor was violently pressed, to force all the blood out; then I was conscious of painful sensation, and I groaned, as I thought, on account of the severity of the pain from squeezing. I felt whatever they were doing to me was now done, and done successfully, and I wanted to express my thankfulness, but I found myself unable to move or speak. Now the hurring commenced, and the light which had hung all the time shining over my head, began to descend, and I with it, and, gradually, the talking became nearer and more audible, the light went out, and the burring sound died away in the distance, and my eyes opened, and with a heart full of gratitude I stretched out my hand to the gentlemen and cried out lustily, "Thank God! thank God!" To which they replied, "It is all right; it is nicely done." I rejoined, "I know it is; I know all about it."

I asked if I had made any groaning when the pressure was applied, and I was surprised to hear that I was not only silent, but also motionless all the time. I took four gallons of gas, and from putting on the face-piece to my regaining consciousness, was seventy seconds.

I was not conscious of any sensation of nausea or giddiness, but a decided consciousness of disturbance, sensation of pricking about the region of the heart, and a great pain about the main artery in the upper portion of the leg, like a severe rheumatic pain, which increased, and though in bed, it settled into a dead coldness and want of circulation, which were not removed till I took two stiff glasses of stimulants; since that I have had no inconvenience.

Expanding the Chest.

Take a strong rope, and fasten it to a beam overhead; to the lower end of the rope attach a stick three feet long, convenient to grasp with the hands. The rope should be fastened to the center of the stick, which should hang six or eight inches above the head. Let a person grasp this stick with the hands two or three feet apart, and swing very moderately at first—perhaps only hear the weight if very weak—and gradually increase, as the muscles gain strength from the exercise, until it may be used from three to five times daily. The connection of the arms with the body, with the exception of the clavicle with the breast bone, being a muscular attachment to the ribs, the effect of this exercise is to elevate the ribs and enlarge the chest; and as Nature allows no vacuum, the lungs expand to fill the cavity, increasing the volume of air, the natural purifier of blood, and preventing the congestion or the deposit of tuberculous matter. We have prescribed the above for all cases of hemorrhage of the lungs, and threatened consumption, for thirty-five years; and have been able to increase the measure of the chest from two to four inches within a few months, and with good results. But especially as a preventive we would recommend this exercise. Let those who love to live cultivate a well-formed, capacious chest. The student, the merchant, the sedentary, the young of both sexes—aye, all—should have a swing on which to stretch themselves daily. We are certain that if this were to be practiced by the rising generation in a dress allowing a free and full development of the body, many would be saved from consumption. Independently of its beneficial results, the exercise is an exceedingly pleasant one, and as the apparatus costs very little, there need be no difficulty about any one enjoying it who wishes to.—*Dio Lewis.*

Nasal Catarrh.—A medical writer says: "I will give a remedy for nasal catarrh which I think of some value. Many cases of catarrh are caused by inability of the liver to perform its functions properly. In such cases there is often a too alkaline condition of the blood. When this is the case, the liver does not take out as much of the carbon and other substances as it should, and the mucus membrane of the nose becomes a dumping ground for the foul matter. If persons thus affected will squeeze the juice of a good sized lemon into half a tumbler of water, and drink it without sugar just before dinner, they will, if they live hygienically, be surprised to see how soon the catarrhal difficulty will diminish. When it fails to do so, it may be considered as due to other causes."

A Ribbon Round the Throat.—The same writer says:—Dr. Ellis gave me a simple receipt for throat and lung affections with which I propose to close this article. Upon my remarking on my tendency to such affection, he said "Now Doctor, you may go home and thank God for having seen me, for I will give you a simple remedy that will be the means of prolonging your life many years. Get a silk ribbon an inch or more wide, tie it about your neck and wear until worn out and then replace it, and continue to do so." I confess I was a little surprised to find a man of Dr. Ellis's intelligence relying with so much confidence on such a remedy, and I asked an explanation of its virtues, but this he was not prepared to give. If any reader tries this or the foregoing remedy, I should be pleased to know the result."

Domestic Economy.

Grapes and Their Use.

The following, from the *Pomologist and Gardener*, is not entirely out of place even in this chosen home of the grape, and especially at this commencement of the grape season:—

A correspondent of the *Pomologist and Gardener* says:—I have often been surprised that so few people know of any other use for grapes than to eat them from hand or to make them into wine. Why, they are good to *cook!* Yes, strange as it may appear, they are most excellent stewed for sauce, make a very rich tart or pie, the nicest of jellies, no fruit better canned. Can be dried with less trouble than most any other fruit. But the seeds, the great rough seeds, what do you do with them? We rough country folks care nothing for the seeds, we eat 'em. But if *you* do not wish to eat them, all you will have to do is to procure a brass wire sieve (they are on sale made expressly for the purpose) with the meshes between the wires just coarse enough so that the seeds will not pass through, squeeze the pulp and seeds from the skins, throw the skins into one vessel, and then rub the pulp through the sieve into another; but when well cooked, if stirred a little, the seeds will mostly settle to the bottom, and he out of the way. To dry them, out the canes with the fruit and all the leaves on them, and hang them in the sunshine. They will dry in a few days, and can then be packed away for winter use, when they will be found better, when properly cooked, than most any other dried fruit.

And the best thing about the whole grape business is that the coaser, easiest grown and most unpalatable of our grapes are the best for cooking purposes. And I have no doubt but that there is now, and will be produced, a line of grapes too pulpy and austere to be eaten raw at all, but will be very fine for cooking, like some pears. I have now a large, beautiful and productive white grape that will keep fresh and sound through the winter, and though entirely unfit to eat, I have no doubt but that it will prove splendid when stewed.

Secrets of Tea-Making.

Chemists tell us that theine is the peculiar principle which constitutes the virtue of tea. Without this element it would be valueless as a beverage. It may interest tea-drinkers who think tea is all right because it comes from China. In California we have some security for the purity of home wines. Grape-juice is cheaper than any material which can be got to adulterate wine; but around the tea-shipping ports of China, millions of pounds of all sorts of leaves are yearly gathered and made into spurious tea, as one-third the cost of the genuine. These are mixed in varying proportions with genuine tea. They are known to the trade as "cheap Canton teas." They are rendered deleterious not so much by the substituted leaf as by the unwholesome chemistry used to disguise the imposition. But last year a new article made its appearance in quantity in the London Tea Exchange. It came from Shanghae, and it was found to be made of willow leaves so perfectly resembling tea as to be detected only by experts. Half a million pounds of this sham tea were made at Shanghae, in 1870. The leaves are gathered in Spring-time and treated exactly as tea leaves in the manufacture. It is all mixed with green teas, in varying proportions of 20 to 40 per cent., according to conscience. The former figure satisfies the Chinese factor, while the conscience of the Christian trader is said to have much greater elasticity. It should be known to tea-drinkers that, instead of theine, the active principle of willow leaves is salacene, which has properties nearly the same as quinine. This is much more sleep-banishing than theine, and its habitual use will generate fatal congestions of the internal organs. Till we raise our own tea, the almost universal adulterations should tend to made us sparing in the use of low-priced teas.

Why Some are Poor.—Cream is allowed to mould and spoil. Silver spoons are used to scrape kettles. The scrubbing-brush is left in the water. White-handled knives are thrown into hot water. Brooms are never hung up and are soon spoiled. Dish-cloths are hung where mice can destroy. Tubs are left in the sun to dry and fall apart. Clothes are left on the line to whip to pieces in the wind. The pie-crust is allowed to sour, instead of making a few tarts for tea. Dried fruit is not taken care of in season and becomes wormy. Vegetables are thrown away that would do warm for breakfast. The cork is left out of the sugar jar, and the flies take possession. Bits of meat are thrown out that would make hashed meat or hash. Coffee, tea, pepper and spices are left to stand open and lose their strength. Pork spoils for the want of salt, and beef because the brine wants scalding.

MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—Utsch's Automatic Jig; A New Type-Setting Machine; Water Supply; An Invention Wanted, 33. The Great Valleys of California, 38. American Locomotives on British Railways; Diamonds in Hydraulic Washings; The Emma Scandal, 40. Commencement Exercises of University of California; Parshall's Continuous Lubricator; A Pomological Curiosity; Report of Chollar Potosi Mining Company, 41.

ILLUSTRATIONS.—Utsch's Automatic Jig, 33. Chinese Joss House, 38. Parshall's Lubricator; A Bunch of California Pears, 41.

CORRESPONDENCE.—Notes of Travel in Eureka County, Nevada; The Vienna Exposition, 34.

SCIENTIFIC PROGRESS.—Position of the Planets for July; Proper Combinations in Soaps; Government Aid to Science; Hardening of Dried Peas in Boiling; An Interesting Chemical Experiment; Agassiz on Development; Making Hydrofluoric Acid; Effect of Sunlight on Flour; Effects of Sulphur Water on Iron Pipes; Exhalation of Carbonic Acid Gas; Reducing the intensity of a Negative, 35.

MECHANICAL PROGRESS.—Steam as a Fire-Extinguisher; New Mechanical Movements; Incrustation of Locomotive Boilers; Machine for Testing the Value of Lubricants; Hot-gilding of Iron; New Plan for Removing Sand Bars; The St. Gotthard Tunnel, 35.

MINING SUMMARY from various counties in California, Nevada, Arizona, Idaho, Colorado, Montana ann Utah, 37-44.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 36.

USEFUL INFORMATION.—Insect Life—Something to Think Ahout; Eyes; Hearing by the Teeth; Cultivation of Fish ii Ditches and Ponds, 39.

GOOD HEALTH.—Sensations Produced hy the Inhalations of Nitrous Oxide Gas; Expanding the Chest; Nasal Catarrh, 39.

DOMESTIC ECONOMY.—Grapes and Their Use; Secrets of Tea-Making; Why Some are Poor, 39.

MISCELLANEOUS.—Clean Up; City Creek Mines; The Sierra Madra Tunnel; Immensely Rich Gravel, 34. Diversion of Butte Creek to Concow Valley, 38. Patents and Inventions, 41. One Half Year's Work; The Emma Mine; Contemplated Water Project; Hydraulic Mining; White Pine Tailings; Sir Samuel Baker's Discoveries; Another Quicksilver Discovery; Interesting to Tobacco Users, 42.

MINING APPOINTMENTS.—Ws see that onr frisnd Mr. Henry Sswell has hsen namsd manager of the Camp Floyd Company's property. The company is now hsing wonnd up for reconstrnction and Mr. Sswsll has requssted them to raise $60,000 for a working capital. This appointmsnt is quite a fsathsr in Mr. Sewell's cap as hs is appointed hy the same Directors who have heen pitching into him so long for telling them ths truth ahout the Utah Silver Lead Co., of Bingham. Ths sams Directore had hoth companiss. They prohahly found ont it was not just the thing to persecuts him as they did. Mr. Sewell was ahout leaving for London when he recsived his appointment, hut he has remained to pull this company through.

We see also that our friend Mr. Riotte partner of Mr. Stetefeldt, and part inventor of the furnace of that name has heen over the mines pretty frequently of late.

He was sent to Pioche to correct some difficultiee in handling the oree there. He was then scnt for to come to Eureka, but was only thsrs a few days, when, ae a correspondent tells us, he was asked to go to the rescue of the Rye Patch mill whers some one else had heen summoned, who was unable to mill the ores to the satisfaction of the company. Ws hear now that Mr. Riotte is in Utah, and is superintending a large mill in that territory.

"PIGEON SPRINGS" a new miniug camp in the Lida Valley county, hae a ledge of galeua 22 feet wide, the ore averaging $400 psr ton in silvsr, and from 40 to 60 per cent lead.

RICH SILVER and copper ore have been fonnd in the Humholdt Rangs, Nev., ahout 11 milse south of Unionville.

THE MINT has coinsd already this month ovsr $1,300,000.

American Locomotives on British Railways.

"It is heyond questiou, he the cause what it may, that the locomotive engines of the United States cost *less* money and do *more* work than English locomotives; yet no English locomotivs superintendent has ever propossd to huild an sngine from Yankes patterns and try it on an English line. The thing would hs contrary to all precedsnt, and therefore is not done."

The above paragraph only recently appeared in the London *Engineer*, and hencs, though not very old, is nevertheless already suhstautially contradicted hy facts, at least so far that an order has heen issued, as follows, for a Dominion road, the head of whose managemsnt is in London. Verily ths world moves.

At the late semi-annual mesting of the Directors of the Canadian Grand Trunk Railway, hsld in ths city of London, where the *Engineer* is puhlished, ths Chairman announced that ths company had contractsd for 300 new American sngines, to take the place of most of the English locomotives which wsre then running on that road, and addsd that the reason for snch action was, "hscause there has heen *enormous progress* in the typs and manufacture of sngines, especially on the Amsrican continsnt. They make thsm thers now *much cheaper than we can buy them here*, and there have been many mechanical improvemsnts in ths mode of constructing engines; and I do uot hesitate to say that 300 new engines of ths present most advanced modern type, mads hy the best manufacturers in America, and coal hurning ars worth 450 of our old enginss, wood hurning. Thersfore, you see yon get this in ths snhstitution of one engiue for anothsr; yon get a large excsss of locomotive power."

Truly this is a most importaut trihuts to American mschanical progress, and to ths snperior model and workmanship displayed hy Americau locomotive huildsrs. That ths complimsnt was not intended for any single manufactory which might have succesded in producing a supsrior machine, or ons which happened to please the English eys, is learnsd from the furthsr statement of the Chairman aforesaid that the contract had hesn made with eeveral of the heet locomotivs huildsrs in ths United Statss.

And This is Not All,

A year ago 600 American cars were purchased for the same road, and a further recommendation has been made that the road bs rslaid with American stssl rails and furnishsd with Pullman cars and other American conveniences, which are not found on English roads or in English shops.

And here we may also say, that American locomotive and American cars, ars now heing generally iutroduced upou the Brazilian and Peruvian railroads in Sonth America, and we may very properly accspt thess facts, as the acknowledgement on the part of intelligent Englieh managsrs, that the trial of Amsrican and English railroad thsory aud practice has fairly rssulted in our favor. If such a trial hae thus resulted in so costly an experiment as railroad managemeut, may ws not rsst assnred, that the same result will follow in othsr, and less important directions.

Referring to the extract from ths *Engineer* prefixed to this article it must hs reasonahly inferred, that prsjudics rather than reason is the great hindrancs in the way of English acknowledgement of ths superiority of American ideas in at least ons important hranch of manufacture; else why, if our locomotives "*cost less money* and *do more work*," will "uo English locomotive superintendent" "hnild au engine from Yankee patterns, and try it on an English line?" The answer follows in ths sams paragraph—"The thing would hs contrary to all precedent, and *therefore* is not done."

Now, howsvsr, that the ground has heen fairly hroken in this Canadian railroad case, in the introduction of some 1,000 tons of American iron into England, the introduction thsre of iron axles and soms other prodncts, to say nothing ahont numerous importent inventions—the Dank's furnace for inetance—may we not hope that facts, hrought to their very doore, will eventually wear away prejudice, and establish "precedsnts?" It may he added, that all of these occurrencss transpire at a time when they are calculated to do ne the greatest good.

ASSESSORS' RETURNE.—The aesessors' returns for the differsnt counties are heing puhlishsd hy the local papers. Ws see Calaveras County mining claims are valned at $121,965, and ths improvemente on same, $131,795. Mining ditchee are valued at $76,915, and the total valnation is, of all property, $6,223,839.

Diamonds in Hydraulio Washings.

Diamonds have again hesn fonnd in the gronnd of the Spring Valley and Cherokee Mining Compauy, in Butte County, California. The Oroville *Record* saw three of them which were taken out at ths last clsan up, a fsw weeks since. One of them is a largs straw colored diamond; anothsr is a small hut remarkahly pure; and the third resemhles ths African diamoud, with which Arnold and Slack salted the ant hills of the plains. The editor of ths *Record* did not learn their wsight or value. The occurrsnes of thess diamonds is not rars in the hydraulic washings of this Stats. Professor Silliman, in a paper read hefore the California Academy of Sciences, in 1867, spoke of having seen them from fivs different localities.

Ths same gentleman not long since made an sxamination of the sauds collected in the sluicss of this same claim; and the microscops revsaled ths fact that they ahoundsd in heautiful colorless zorsons (hyacinths) of the form well known in ths hyacinths of Expailly, Francs, associatsd with crystals of topaz, qnartz in fragmente, rounded grains of chromic aud titanic iron, and a few small, almost glohular, masses of very high rsfracting power, which appeared to he diamonds. To determine this chemically, a portion of ths sands were treated so as to bs fresd from anything which could afford carhonie acid hut ths diamond, and further experiments proved that diamond powder was present in small quantity. Ths method employed was giveu in our issue of April 19th, 1873. Professor Silliman stated that when he was provided with a largsr amount of ths eands, hs propossd to detsrmine the amouut of diamond dust quantitatively. In ths sxamination made hy him, it was fouud that the hlack grains, which constituts fully one-half the hulk of ths Butte County sands, are ahout equally chromic iron, which ths magnet removes, and titanic iron, which is uaaffected by the magnet. No metallic grains of any of the platiuum or iridosmium metals or gold could he found.

It is thought that hy a mors careful examination, hy experienced syss, of the accnmulatsd sands of hydraulic washings, many rare speciss of minsrals may he found, which havs as yet escaped notics for want of scientific ekill. Dr. John Torrey found no less than twenty distinct mineral epsciee, many of them of rare occurreuce, in a sampls of eauds from Nicaragua Placer mines.

The Keystone Mine Patent.

Ths Commissionsr of the General Land Offics has issued patsnts for ths claime of ths Keystous Mining Company, on the Keystone, Spring Hill and Geneva mines, in Amador county. Thsss patsnts wsre issued under the late decision of ths Secretary of the Interior. Ths original claim to the Keystone mine, which was raised hy sharp epecnlatore, involved the question of wide application, ae to whsther the grant to ths State of California of ths sixteenth and thirty-sixth eections for school pnrposss, under the Act of March 3rd, 1853, included eaid ssctions, whsn they wers on mineral lands. The Secretary'e decision, which was referred to at length in our issue of May 3d, was as follows:

First.—That title to said sections sixteen and thirty-six, does not vest in the State until a survey hae been made, which hrings into existencs and locates said sectioue, and that said miuing companiee having appropriated said lands under the Act of July 20th, 1866, prior to such eurvey, they had ths better right.

Second.—That the eeventh section of the Act of 1853, excepts from the grant all of sections sixteen and thirty-six on which there had heen prior to the snrvey a settlement, by the srection of a dwelling houss, or the cultivation of any portion of the land, and that the settlement referred to was technically known as the "pre-emption settlement."

Third.—That the grant wae not intsnded to inclnde, and does not include, eaid sections when they are ou mineral lands.

The points in the decision were very important ones, as they established a principle which protecte honest minere from the schemee of wily speculators, who want to profit by the work dons hy the minere in good faith, hy a msrs legal technicality. Strenuous sfforts wsre made to gain a decision contrary to what was rendered, hut fortunately with no success. The Keystone Company now have good title to their gronnd, and the dscision in their favor protects others in similar circumstances.

The Emma Scandal, or Mrs. Grundy.

Written for the PRESS.

Well, well, Mrs. Grundy, the old woman who employs herself ahont other people's husiness, even if she has no facts to hack her statements with, has heen husy about that old "Belle," ths celehrated Emma, and is trying to maks it a "canse celehre." Bnt it so happens that a person with sxpressive syes and aquiline uose, who resemhles an eagle as much as anything I have seen, is after the old lady and has stuck his claws pretty deeply into her.

The scandal, this time, is about a flashy girl called Emma. Mrs. Grundy, it appsars, got some of her old friends, Park & Co., of Mariposa, etc., etc., to puff up this fashionahle "Belle." But finding no markst for her in their own country, they took her to London, and succeeded, with ths aid of diplomatic relations, to marry her to the honorahle Mr. John Bull. It was not long hefore ths honorahle hushand snspected her of possessing false teeth, etc., etc., which brought on serious diffsrences with his newly acquirsd matrimonial prize, whom he also found had deceived him as to her wealth.

He detsrmined at last to employ the eagle-eyed aquilins-nosed doctor, to investigate this unsatisfactory state of things. Ths doctor soon found that Mrs. Emma had many more falss things ahout her than was suspected hy her doting John, and reported accordingly. Those who palmed her off were on ths lookout, and remonstrated in a most formidahls mannsr through the press, and stated, with all the elsgance, hut minus the logic, they possessed, that the doctor was eimply "hsaring" Mrs. Emma down, trying to hring ahont a divorce case, so tbat the lady should, with all her millions, fall into the hands of his own immediats friends, who, they said, had promissd to do ths right thing by him.

The doctor, who is a wide awake sort fellow, determined to upset the Emma-Mariposa-apple-cart and gave ths honorahle hushand to understand that if hs had the slightest douht as to the state of things he would call in two other physicians, (one of whom had spent a summer in Mariposa, and, therefors, fully competent to decids on this case). The verdict of the other two physicians differed in no mauner from that of ths eagle-eyed doctor, which is as follows: That her rsputation for heauty and intrinsic value was far heyond her merits, hut that, notwithstanding the great deception practiced on Mr. Bull, with proper treatment shs conld he hrought ronnd to raise a hig and thriving family, if time and patisnce were allowed.

Now, sir, this ths plain etatemsnt of the case. Youre, truly, PUNCH.

P. S.—My address is Mr. Punch, Flest St., Loudon. Shall be happy to place myeelf in future communication with your eminent firm.

SOME VANDAL thief, went into the Geological museum of our friend Henry G. Hanks, at No. 649 Clay street, ons day this week and rohhed ths cases of a quantity of the richsst gold and silver specimens, together with thrse valuahle medals, which had heen presented to Mr. Hanks hy ths Mechanics' Institnte, the State Fair, and an English Inetitution. Thsy took some large epecimens of tin ore at ths same time, hut finding them of no valne left them on the door step the sams evening. The mnssum has usually besn lsft open for the henefit of visitors, hnt Mr. Hanks will, after this occurrence, prohahly havs to he mors carefnl, and kesp the place locked or have some one in attendance.

TIMES are livsly at Eureka, Nsv., as ths minee ars giving svidsncs of permanency, and the furnaces are wsll snpplied. There are few idle men, and everybody is satiefied with ths prssent and future prospscts.

CALAVERAS COUNTY CITIZENS havs formed a club or association similiar to ths Tnolumne County association, for the purposs of promoting friendly social relations among residents and ex-residente of the connty.

THE LAST CLEAN up of the Idaho Mine (Grass Valley) after a fonr days' rnn, wae $15,000. The amount for the month is $77,500, or $25 per share.

A DITCH 97 miles long is supplying a mining camp, 40 miles in exteut in Baker County, Oregon; considerahle gold is hsing taken ont this season.

THE WATER-LEVEL tunnel on ths Butts mine, now heing run, will cnt the Butte ledgs of ths Rys Patch Company 600 feet from ths surface.

THE sum of $20,000 has already hesn spsnt in the development of a coal mine, near Mark West Spriugs, Sonoma c'ounty.

THE Baldwin Expedition, to explore the mineral resources of Sonthern Utah, has started from Salt Lake City.

THE HUMBOLDT LEDGE, near Dnn Glen is again heing worked. Ths ors will hs worked by the Krom Coucentrator, in Star District.

Commencement Exercises of the University of California.

The closing exercises of the University, at Oakland, were witnessed with much pleasure by large nnmbers of onr citizens and strangers. The gradnating class nnmbers twelve, of whom hnt five are academical students, the remaining seven having taken the partial course. Want of space forbids onr entering as much into detail as we wonld wish. We can give but a brief review of the events that mark the termination nf the University year of 1873.

On Monday evening, Jnly 14th, the annual reunion of the Iota Chapter of the Zeta Psi Fraternity took place. On Tneeday, selections from the gradnating theses of the class were read. Judging from the subjects treated, the stndents are especially devoted to

Practical Science

And topics of local moment. We append the titles of the theses, with the names of the orators:

"The Vigilance Committee;" by Nathan Newmark, of San Francisco.

"Placer Miuing in California;" by Frank Otis, of San Francisco.

"The Metric System;" by L. L. Hawkins, of Oakland.

"The Reclamation of Marsh and Swamp Lands;" by John M. Boulton, of San Francisco.

"Forestry;" by Thos. P. Woodward, of San Francisco.

"The Commercial Policy of the Uuited States;" by Jacob Reinstein, of San Francisco.

"Boiler Explosions;" by Ebenezer Scott, of San Francisco.

"The Novel;" by Clarence J. Wetmore, of Oakland.

"Cherry Culture in California;" by Frauklin Rhoda, of Frnit Vale.

"Irrigation;" by James H. Budd, of Stockton.

"Practical Applications of the Parahola;" by George C. Edwards, of Visalia.

"P ossible Improvements iu Railroad Constrnction;" by George J. Ainsworth, of Portland, Oregon.

That such should be the hent of inclination and the professed taste of the young gradnates, is matter of gratulation to all who wish to see our State rapidly advanced; and this end will only be obtained hy the inculcation and adoption of just snch lines of thought as were evinced by the topics touched on.

As compared with the ordinary tone of Commencement speeches we have had the misfortnne to listen to elsewhere, this positive practicality was the distinguishing mark. The credit of having instilled snch ideas into the edncational conrse pnrsned at Oakland is, in great part, due to the energetic President, Prof. Gilman.

After the reading of the theses, the candidates for degrees of A. B. and Ph. B. were presented,and honorary appointments annonnced. At the cloae of these performances, the members of the Aasociated Alnmni of the Pacific Coast held their business meeting. In the evening, the usnal Alumni hanquet (!) was attended hy the gradnates of the different Collegea and friends of education generally; the scene, of course, heing gracod by the presence of the ladies. It was noticed that the Yale element largely predominated. The opening address of Col. Barnea was a most spicy piece of compoaition, and the Col. was equally fortunate in remarks made during the evening. Other speeches, hy Gov. Booth, Prea. Gilman, Hon. S. J. Field and othera, followed, in response to the varioua toasts of the occasion. Theae were quite intereating; bnt, it mnst be confeased, were aomewhat atiff, and hardly took the place of the genial *camaraderie* which marks snch rennions elsewhere.

The Commencement proper was on Wednesday, the 16th, and consisted of the Latin salntatory, by Frank Otis; the valedictory, by N. Newmark; the President'a address to the class; the

Conferring of Degrees

Upon Nathan Newmark, Frank Otis, Jacob Reinstein, Ebenezer Scott and Clarence J. Wetmore, the degree of Bachelor of Arts.

Upon George Jennings Ainsworth, John M. Bolton, James H. Bndd, George C. Edwsrda, Leander L. Hawkins, Franklin Rhoda, Ebenezer Scott and Thomas P. Woodward, the degree of Bachelor ef Philosophy.

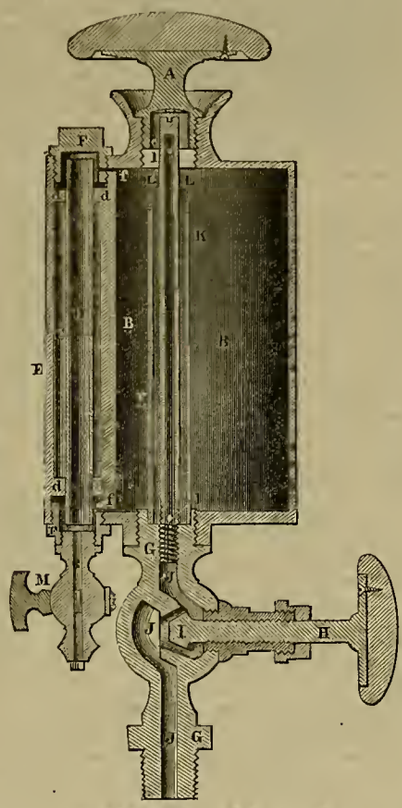
Then followed a congratnlatory address to the President, by Gov. Booth; and the presentation nf a portrait nf Bishop Berkeley, whose prophetic words, "Westward the conrse nf Empire takes ite way," have heen so much qnoted and so remarkably fnlfilled.

The alnmni of the University met in the evening, after which a very pleasant reception was given hy Pres. Gilman.

Altogether this Commencement may be said to have been a success. It certainly furnished a highly enjoyable and most interestiug series of events.

Parshall's Continuous Feeding Lubricator.

We give herewith an illustration of C. H. Parshall'e continnous-feeding lubricator for steam engines, a recently patented invention, which is claimed to be nnusually economical, lubricates continnally and needs no watching. These lubricators are suited to all steam engines, deliveriug the lubricant, whether tallow or oil, to every kind, equally well. Iu the accompanying cut, *A* is the screw cap or stopper, *B*, cnp for lubricant, *C*, hot air chamber, *D*, glass tube in chamber showing the amonnt of water and of oil, *E*, glass face to chamber, *F*,



PARSHALL'S LUBRICATOR.

screw capa to glass tube, *H*, valve stem, *I*, valve head, *J J*, steam duct throngh stem *G K K*, oil tube screwed at bottom into stem *G*, *L L*, steam tube within *K K*, and screwed also into atem *G*, *M*, common fancet, *d*, packing around ends of glass tube, *f*, passagea admitting oil into glass tube, *l*, elongated hole in tnhe *L L*, at connection with stem *G*, *l'* lateral hole near top of tube *L L*.

In operation the steam risea through the dnct *J J*, the valve *I*, standing open, and through the tnbe *L L*, and the lateral hole at *l'* near the top of aame, into the top of the cup *B*. The oil, as the steam condensea, rises over the top of the tube *K K*, flowing down the tube and through the elongated hole *l*, in the bottom of the tube *L L*, into the duct *J*, and thence on through the valve *l*, and the other part of the duct to the parts of the engine to he lubricated. When condensation of the steam begins, the water settles helow and raises the oil to the top. All sediment in the oil settles to the hottom of the cup, and the oil ou going to feed the engine is alwaya pure. The rate of flow or feed of the oil, ia regulated by the size of the elongated hole *l*, which can he made smaller, or stopped altogether, hy screwing the tube *L L*, down into the stem *G*; the tube *L L*, is formed with a head like a screw for that purpose.

The glass tube, *D*, indicating the helght of the water and the remaining amonnt of oil iu the cnp, standing in the chamber, *C*, is within the circumference of the cup aud is always bot, when the cnp is in aervice. The object of the valve, *I*, is to shnt the steam from the cnp, and that of the faucet, *M*, is to let the water ont of the cnp. To refill the cup, when the steam is on, the valve, *I*, is closed, and the faucet, *M*, is opened. When the water has run ont, the faucet, *M*, is again closed and the oil put in, after which the valve, *I*, is opened againu, and the steam passes up into the cup. These lnbricators may he placed on the steam-pipe, steam-chest cover, or the cylinder-head, as may be desirable. They admit the steam freely to the lnbricant, which is constantly permeated with it, aud therehy kept in a free, liqnid state. Numerous testimonials to its efficiency are presented. Parties desiring further information may obtain it from Wiester & Co., No. 17 New Montgomery street, in this city, they being general agents for the Pacific Coast.

A Pomological Curiosity.

Many of onr readers will recognise the accompanying engraving as a representation of

BUNCH OF CALIFORNIA PEARS.

a remarkable bunch of pears, which was exhihited at the Mechanics' Institute Fair of this city, in 1865. The engraving has heen made from a photograph, many of which were taken and distribnted at the time. The pears were of the *Louise Bonne de Jersey* variety, and were plucked from a tree in Mr. Brigg's garden, at Marysville, and consisted of 54 in number. It presents another remarkable inatance of the wonderful pomological productions of California.

Sierra County Mines.—A Correspondent writea us, that the Rocky Point Miuing Company have met with flattering success in their operationa. The tunnel has been run through from wall to wall, and showa a ledge of 13 feet in width. A working test at Strong's Metallurgical works in this city, showed a result of $292.28 per ton. The favorable location of thia mine, together with the advantage of ample water power, will enahle the owners to mine and work their ore for less than $4 per ont. The company are now disposing of sufficient stock to erect a mill, and expect to he in full operation in ahout four months. Capitalists need not look heyond our own State for investments in mining propertiea.

Virginia City bridal couplea are presented with silver bricks, on which is engraved their names and an appropriate conplet such as this:

The joys of Heaven on earth are known
To those who live in love alone;
As silver gleaming in the light,
Be e'er your joys as pure and bright.

The Washington Quicksilver mine, near Napa, turned out forty flasks of quicksilver last week, an increase of ten flaaks over tho previoua run, with only six men at work.

The ore shipment from the Comstock minea to varions mills is now about 95 tons per day.

Patents & Inventions.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, DEWEY & CO., Publishers and U. S. and Foreign Patent Agents]

By Special Dispatch, Dated Washington, D. C., July 15th, 1873.

For Week Ending July 1st, 1873.

Harvester and Thresher.—James H. Adamson, assignor to Wm. Taylor and M. Stewart Taylor, S. F., Cal.

Type.—William Shaw, Hollister, Cal.

Engine Governor.—Joshna Hendy, S. F., Cal.

Rotary Blower.—Richard F. Knox, assignor to Palmer, Knox & Co., S. F., Cal.

Bed Bottom.—Clinton V. B. Reeder, San José, Cal.

Hydraulic Hoisting Apparatus.—Philip Hinkle, S. F., Cal.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue. Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Report of the Chollar-Potosi Mining Company.

The annual meeting of the Chollar-Potosi Mining Company was held in this city on the 14th inst. The names of the officers will be found in another column. The report of the Superintendent makes the following statements:

"For the year ending May 31, 1873, operations at the Company's mine have been steadily prosecuted with the following results: Ore extracted, 48,200 tons; ore reduced at mills, 44,050 tons. Ore supplies for the past twelve months have been drawn from the old and long developed portions of the mine. Notwithstanding much prospecting work has been done in quartera of the mine that indicated the existence of the precious metal, our labors and expenditures of money are, I regret to say, unrewarded, and the hoped-for deposits of ore are undiscovered. At fourth station of shaft, in drift north, there are strong probabilities of our getting ore of average quality; every effort has been vsinly made to reach this body of ore said to exist near this company's north line. In connection with the ordinary machinery, we have added a machine for compressing air—said air to he used as a motive power at low levels. Owing to delays in perfecting the compressor, no use has heen made of it. Concerning the reserves of ore, no correct estimate can be made. The quantity developed at this time is more extensive than the known supplies were one year ago. During the past twelve months much of the ore milled was largely impregnated with base metals, causing much difficulty in reducing and materially curtailing the results in hullion."

Of the 48,200 tons of ore extracted, 14,000 tons were from the Blue Wing Station, west, 13,000 tons from the Piute, 11,150 tons from Grass Roots, aud 10,050 tons from second station, new shaft. While the quantity extracted is 10,000 tons in excess of the previons year, the net returns were cousiderably less, because the ore turned out was of a lower grade. The shaft has heen thoroughly overhauled and repaired, and is now in complete condition. Though the developments made have not resulted in the discovery of paying ore, the indications at the close are more favorable than for some time. Tho Secretary's report presents the following financial exhibit for the fiscal year:

RECEIPTS.

Proceeds of bullion sold	$685,724
Assessment No. 4	140,000
Miscellaneous	5,488
Total receipts	$831,212
Cash, per last statement	174,149
Total	$1,005,361

DISBURSEMENTS.

Working ores	$483,255
Labor	198,853
Timber and Lumber	57,305
Machinery and materials	43,726
Hardware	16,637
Wood and Coal	12,780
Candles and Oil	3,973
Freight charges	11,272
Discount and assaying	10,891
Office expenses	8,841
Water	6,600
Taxes	4,427
Legal expenses	6,106
Miscellaneous	7,302
Total disbursements	$871,968
Cash on hand	133,393
Total	$1,005,361

The average cost of working the 44,050 tons ore crushed during the year was $15.62 per on.

During the fiscal year euding June 30, 1873, there were 5678 new incorporations formed in this city; of this number 376 were for the purpose of pursuing miuing operations.

Healdsburgh is becoming a quicksilver market, that town being the base of supplies for the minera in the vicinity.

Our Half Year's Work.

Exports of San Francisco for the Six Months Ending June 30th, 1873.

From the following statistics, it will he seen tbat the stride made in our foreign commerce during tbe last six months has been a vast one. The whole of the exports for the six months ending June 30th, 1872, including those hy railroad, may be valued at $13,000,000, and those for the same period of the present year at $17,000,000, showing an increase of $4,000,000, or ahont 32 per cent. This is most gratifying, especially when it is taken into consideration that, during the same period, our imports have, as shown hy the freights paid, slightly diminished. But our exports of treasure have decreased by $2,028,259, thus leaving the increase of exports to he abont 16 per cent. The decrease in the export of gold and the increase in the export of produce show that our commercial system is fast righting itself and that we may in the future expect few such years of financial tightness as during the first half year of 1873.

The following table, taken from the "Bulletin," shows the quantity and value of our Domestic Exports for the period in question:

Articles.	Quantity.	Valne.
Abalones, sks	692	$7,629
Asphaltum, tons	12	266
Barley, 100-lb sks	61,637	91,944

" cases	3,262	
Wool, lbs	198,869	55 447
Total		$11,269,761

The Destination

Of our wheat has been nearly all to Great Britain, that exported to other countries not reaching an amount of 1,000 centals. More than half of our Flour went to China and Japan, the balance chiefly to Central America, New York and Great Britain. The latter may he considered a new market. Australia and New Zealand took five-sixths of our Barley export; China and the Hawaiian Islands two-thirds of the Oats exported; and New York all the Wool, with the exception of 11,824 lbs. which went to Great Britain. All our Hides found tbeir way to New York; nearly all our Quicksilver to China and Mexico. All our Wine, save about 10,000 gallons, went to New York. The following tahle exhihits clearly the destination of all our principal exports:

FLOUR.

		Value.
New York, bbls	10,294	$59,328

Our Merchandise Exports by Water

For the half year have aggregated $13,658,695, as against $7,662,387 for the first half of 1872, showing an increase of $5,996,238, or nearly 79 per cent. This is on the whole, for the exports to New York show a falling off of upwards of a million dollars; those to the Hawaiian Islands of $8,640; those to British Columhia of $16,638; those to Mexico of $39,784; and those to Japan of $126,969. In fact, exports to all countries, save Great Britain, Australia, New Zealand, Society Islands and Philippine, show a decided falling off. But the increase to Great Britain alone, in itself nearly six hundred per cent, is more than sufficient to make up for a hundred such losses.

The following tahles show the exports by water for the first half years of 1872 and 1873, to all countries with which we have communication; the details of the exports of Flour and Wheat for the same periods; and the weight in pounds of the export by railroad, for the first five montns of the year:

Exports by Sea for the First Six Months of 1872 and 1873.

THREE thousand dollars were recently obtainsd from six pans of gravel, out of the Moser & Haworth olaim, Calaveras county.

The Emma Mine.

The Sslt Laks *Journal* says: We are happy to bs abls to announcs that ths Emma, ths vsry queen of Utah mines, has agsin sssumed, in a partial but sncouraging degree, hsr formsr position as a grand silver ore producing mins. From various causes the Emma has been under a cloud for several months, snd ths bsd sffects of ths evil croakings in Englsnd and America concerning ths unfortunate situation of ths mins, havs had a most depressing effect on ths mining prospscts of Utah, hers and abroad. Ths mins was for a long timsths leading one of the Tsrritory, and bettsr known ths world ovsr, perhaps, than any in ths country, nsxt to ths Comstock Lods. Ths so called failure of ths mins acted as a wst blankst on all operations in Utah mines here and abroad. Evsry one thought, because the Emma had failed and British stockholdsrs had lost largsly in their investments in its stock, that there could be nothing in Utah. The mine reprssented to the great mass of the people, Utah's mineral wealth, and when it fell, sverything in the Territory got a "black eye," as they say on changs. It is for this reason that we are glad to be abls to say on excsllent authority that the Emma is again in a most flourishing condition. Work is now being done on a largs body of ore, which was discovered some months since, and which we alluded to atthe tims, and ore is now being shipped and sold here in considerabls quantitiss which assays, in the sample mill, 550¼ onnces of silver to the ton, and carriss fifty per cent. of lsad. A number of tons of this grade have already bsen sold at this rate, and a largs qnantity is awaiting shipment. Two car loads going 200 ounces to the ton wers sampled yesterday, and plenty more is coming.

Under these circumstancss, and with the promising future before it, we cannot hssitats to congratulate the stockholdere on the brilliant promiss of the mine, and sxpress our satisfaction at the agreeable turn of affairs which have been going somewhat adverse to the best intsrests of ths Tsrritory.

CONTEMPLATED WATER PROJECT.—Ever since the purchass of the ditches and water rights on the Gsorgetown divide, by the California Watsr Company, it has been surmised that this company had in view no less an undertaking than that of eventually supplying the towns of the Valleys, from Sacramsnto to San Francisco, with pure, crystal water from the mountains. Subsequsnt operations of this company have tended strongly to confirm these suspicions. The substantial character and enlarged capacity of all thsir improvements along their present canals; ths large force at prsssnt employed in extending their works to the South Fork and the outlets of Loon Lake, Plsasant Lake and many others, with their survsy extending to the Rubicon; the employment of Mr. Amos Booman, a thoroughly competsut enginser and surveyor, to maks a topographical survey and map of the entire route, and of the whols region of country lying between the south and middle fork of the American rivsr, are snfficient evidence that this water company means business of no ordinary dimensions. That these cities and towns will at some future time be supplied with watsr from the mountains, and that the California Water Co. has in contemplation this vast project, is no longer a matter of doubt. The enterprise is a vast one, yet it possesses all the requisites of success, viz: an unlimited supply of water, a practicable route, already dsmonstrated such by their present ditches traversing the first sixty miles from the mountsin lakss and rivsrs to the very foot hills of the plains, and a demand for ths water as everlasting as it is inevitable. Ths character of the men engaged in this enterpriss, the capital at their command, it is believed, are commensnrate with the undertaking.—*El Dorado Republican.*

HYDRAULIC MINING.—A gentleman rsturning from a tour through the mining districts of Nevada county, bsfore leaving for San Francisco yestsrday, expressed to us his surprise at the number and sxtent of the mining operations in successful working in almost every part of the upper portions of our county. There is no question, though we maks little blow about it, that Nsvada is the banner county of ths State in hydraulic and quartz mining. We have, it is trus, no Yosemites to attract pleasure ssssksrs to this locality, and no wild cat spsculations to place upon California street, but when the narrow gauge is in running order from Colfax we expect to attract hither individuals who dssire to make psrmansnt investments, bnt ars so dslicately constituted as to be deterred by the fear of a ride of some ten or twelve milss over a stage road. We will have palacs cars on our narrow gaugs expressly for ths accommodation of such, and shall then expect to ses them "flocking as doves to our windows."—*Grass Valley Union.*

WHITE PINE TAILINGS.—Emulating ths success of the Washoe Tailings Mills, one of the same description is being erected at Shsrmantown, White Pine, by J. B. Osborne. The *News* says five pane will be added to the mill, and a powsrful sngine is now being placed in position. Mr. Osborne has been trying to work the tailings with insufficisnt material, but will now erect works competsnt to do the work.

RICH QUARTZ has been found in the Cœur d'Alene mountains, and brought into Walla-Walla.

SIR SAMUEL BAKER'S DISCOVERIES.—London, July 7.—Ths *Herald's* corrsspondent at Khartoun telegraths, via Alexandria, confirming ths arrival of Sir Samuel and Lsdy Baker and party, all ths details of which ars known from previous dispstches. Hs adds:

"Sir Samusl Baksr succeeded in organizing district governments, appointing supsrintsndsnts, and making Fatiko ths chief station, Gondokooro being nsxt in importance. Hs also sstsblishsd eight other principsl posts, which form a connected chain from Nubia to Nyanza, and obtained ons thoussnd additional troops. An important geographical discovsrer is ssid to havs besn msds, which will astound ths scientific world, as it is said thst Lak s Tanganyika and Albert Nyanza provs to bs ons and ths same body of water, and a magnificsnt inland sea, 700 miles in lsngth. It is further announced that vessele can be landsd above the falls named Sir Roderick Murchison, and sail to Ujiji. Sir Samuel Baker and party were in excellsnt health, and were to leavs at once for Souakim, en route to Suez." The above narrative is dirsct from the explorer's lips.

IN every direction for a distance of fifty miles up and down the Ssn Ynez valley, by a width of tsn or twelve miles, the country is covered by a dense growth of white oak timber; down to the coast it exists in about the sams quantities as in this section. We msasured several trees that were eighteen fset in circumfersnce, many of which contsined not less than twenty cords of four foot firs-wood, each. The question is, can this vast body of timber, amounting to many millions of cords of wood, be cut, transportsd and put into market at rates that will leave a margin for profit? As a railroad is doubtless practicable from the ocean to this great forest we believe it would pay to build a cheap railroad, for ths transportation of this wood to tide water, if for no other purposs. The subject is worthy the attention of capitalists, inasmuch ae the timber resources of the coast counties, at least those contiguous to market, ars very nearly exhausted.—*Santa Barbara Index.*

ANOTHER QUICKSILVER DISCOVERY.—We were shown to-day, says the Petaluma *Argus* of the 8th instant, a spscimen of cinnabar that was discovered in this county, a few miles from the Geyser Springs, in a westerly direction. W. Forbes, of Laksport, is one of the principal ownsrs of the mine, which was discovered about six wseks ago by Msssrs. McKay, Sloper and Snow. Ths specimens are undoubtedly the richest "croppings" ever yet discovered, and if a well defined lode is developed, the mins will certainly prove a sours of great wealth. The mineral wsalth of Sonoma county is still in iit infancy, yet we predict that a few ysars from now our mines will develop a profitable revenue.

THE Trinity *Journal* says: Mr. Jos. McGillivray, has lately purchassd anothsr right of watsr in Cañon Cresk, and ws are informsd, intends to convsy watsr to the mines of Red Hill and vicinity. The ditch will be of the capacity to carry five thousand inches of water, and the water will be taksn across Trinity river in a largs iron pipe to the top of Red Hill, at a hight to cover all the known mines up and down the river for eight milss. The cost of this undsrtaking will be not less than sixty or seventy thousand dollars, but when completed cannot fail to yield a large profit, for the mines to be supplied by it are known to bs extremely rich.

AN ordinance has been read the first time in the Board of Aldermen of Virginia City, which providee that no Giant or Hercnles powder, gun cotton, nitro-glycsrine, or gasoline shall be storsd or kept within the city limits; that not more than ten casss of coal oil of ten gallons each shall bs kept in any one building, and that not more than twenty-five pounds of gun, blasting or black powdsr shall be kept in any place of business in the city, and that the latter shall be kept in metallic casss, secure from fire. The penalty for a violation of the ordinance is a fine of not lsss than $20 nor mors than $500, or imprisonmènt for not less than ten days nor more than six months, for each offense.

THE *Territorial Enterprise* says: The water in the Carson rivsr is becoming quits low; it is not as low, however, as it was at this time two years ago. The Eurska Mill, the largest on the rivsr, is still running to its full capacity. The millmsn do not fear losing much time this summer. They think they will be able to run the most of their machinery during the entire season, and say that as soon as the weather begins to grow cold, this fall, the water will incrsase in volume, from the dscrease in evaporation, probably.

THE Ventura *Signal* learns that at the Pirn mines thsre are now about sixty msn at work. They are doing wsll, working in rich ore, and a quartz mill will soon be srected by parties from San Francisco. Trade mostly goss to Bakersfield. This is a trade we should havs, the minss are in our county and quite near us.

INTERESTING TO TOBACCO USERS.—Dr. J. Richardson, of Philadelphia, has discovered that the corpuscles of the saliva are migrating white blood-globulss. So the more you spit the more you rob your systsm of blood. Smokers and tobacco chewsrs will do well to take notice.

THE Japaness Mint has already coinsd 15,500,000 pieces of gold and silver, valued at $20,178,000.

DEWEY & CO.,
American & Foreign Patent Agents,

OFFICE, 28 MONTGOMERY STREET, S. F.

The best, speediest, and snrest method for yon to obtain patents, file caveats, or transact any other important business with the Patent Office at Washington, or with foreign countries, is through the agency of DEWEY & CO., PUBLISHERS OF THE MINING AND SCIENTIFIC PRESS, SAN FRANCISCO, an able, responsible, and long-established firm, and the principal agents on this side of the continent. They refer to the thonsands of inventors who have patronized them, and to all prominent business men of the Pacific Coast, who are more or less familiar with their reputation as straightforward journalists and patent solicitors and counsellors.

We not only more readily apprehend the points and secure much more fully and quickly the patents for onr home inventors, hut with the influence of our carefully read and extensively circulated journals, we are enahled to illustrate the intrinsic merits of their patents, and secure a due reward to the inventor, hesides serving the public who are more ready to give a fair trial, and adopt a good thing, upon the recommendation of honest and intelligent publishers.

To Obtain Patent,

well-constructed model is generally first needed, if the invention can well be thus illustrated. It mnst not exceed 12 inches in length or hight. When practicable, a smaller model is even more desirable. Paint or engrave the name of the article, and the name of the inventor, and his address npon it.

Send the model (hy express or other reliahle conveyance), plainly addressed, to "DEWEY & Co., MINING AND SCIENTIFIC PRESS OFFICE, SAN FRANCISCO." At the same time, send a full description, embodying all the ideas and claims of the inventor respecting the improvement describing the various parts and their operations.

Also send $15 currency, amount of first fee of the Government. The case will be placed on our regular file, the drawings executed, and the documents made np, and soon sent to the inventor for signing.

As soon as signed and returned to us with the fees then due us, it will he sent straightway to the Patent Office at Washngton.

When the invention consists of a new article of manufacture, a medicine, or a new composition, samples of the separated ingredients, sufficient to make the experiment (unless they are of a common and well-known character), and also of the manufactured article itself, must he furnished, with full description of the entire preparation.

For Processes, frequently no model or drawings are necessary. In such case, the applicant has only to send us an exact description, and what is desirable to claim.

For designs no models are necessary. Duplicate drawings are required, and the specifications and other papers should he made up with care and accuracy. In some instances for design patents two photographs, with the negative, answer well instead of drawings.

For further information, send a stamp for our illustrated circular, containing a digest of PATENT LAWS, 112 illustrated mechanical movements, and HINTS and INSTRUCTIONS regarding the RIGHTS and PRIVILEGES of inventors and patentees, which will be furnished post paid. Also a copy of NEW PATENT LAW of 1870.

The California Powder Works

No. 314 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,
MINING,
And BLASTING
POWDER,

Of SUPERIOR QUALITY, FRESH FROM THE MILLS. It being constantly received and transported into the interior, is delivered to the consumer within a few days of the time of its manufacture, and is in every way superior to any other Powder in Market.

We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRICULTURAL SOCIETY for the superiority of our products over all others.

We also call attention to our

HERCULES POWDER.

Which combines all the force of other strong explosive now in use, and the lifting force of the BEST BLASTING POWDER, thus making it vastly superior to any other pompound now in use.

A circular containing a full description of this Powder can he obtained on application to our Office.

BURLEIGH ROCK DRILLS
—AND—
Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A.....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.
Col. Roebling .....East River Bridge Company, N. Y.

For further information, etc., address

L. C. PARKE,

(Continued from Page 37.)

They are drifting and sinking, and the quality of ore raised is steadily improving.

The English Co. on the Kansas Extension are working their property steadily, crushing the ore at their mill in Black Hawk.

A most worthy, and highly beneficial enterprise to the development of the mines above Russell district, is the tunnel which has been bravely and persistently driven towards the heart of Clifton mountain for several years. This tunnel starts from near Russell Gulch, and has now attained a length of nearly 700 ft. It is designed to cut the lodes that rib this mountain at a depth that will enable them to be worked to much greater advantage than by means of shafts.

CLEAR CREEK COUNTY.—Bennett & Chapman have cut the enormously rich Saco mine above Georgetown with their tunnel, and after going through three feet of 600 ounce silver ore had not reached the inside wall of the mine. This proves, that the portion of the mine leased by them will exceed in richness and extent even the wonderful product of other parts of this lode.

PARK COUNTY.—Mining affairs are prosperous in Park County, and the Mines, especially the Moose and Hiawatha, are turning out very profitably. Clark & Smith are working 200 men on their five mile placer property at Fairplay. The Phillips mine is supplying iron for Dudley's and Hill's works. Dudley's works have been crowded with work since they started last season and are very successful. Fairplay is growing rapidly. There are hut few idle men in Park county at present.

Idaho.

THE WEATHER, WATER AND MINES.—Idaho *World*, July 10: During the past week it has been warm and sultry, though the nights have been cool and pleasant. The effect of the "warm spell" has been to dry up, to some extent, the water, and diminish the quantity running in the ditches. On the other side of the Basin, near Placerville, the water has gradually failed, until but little, if any, is now running in the ditches at that camp, though Crowly, Brogan & Co. still have a fair supply on their diggings at Granite Creek. Messrs. Eisler & Hughes run no water through their ditches to their digginga at Lady's Crevice, and vicinity, though they still have water on their claims in Ophir Creek. Centreville is still well supplied with water by means of Channell's and Goldtrap's ditches. Hon. Ben. Wilson, of Pioneer City, owning about all the ditches in that camp, still has an abundance of water, and our old friend, Bob McGinness, whom we met at Placerville last Sunday, informed us that mining oparations were in full hlast in that section, with everyhody at work. Around Idaho City the water is gradually failing in several ditchea. Willis & Driscol with a fair supply in their ditch are still runuing their claims on Gold Hill, while West & Ralston, who get their water from the "Big Ditch," are still working their claims in Bear Run. Tompkins & Lambing having their own ditch, are still at work on their hill claims hetween this place and Morestown, though we understand that their water is falling and in a few days they will be compelled to suspend operations for this season. Quite a number of claims are still heing worked on the South side of Moore Creek, heing furnished with water from the Shafer ditch, while Hill & Reardon, who own the Thorn Creek Ditch, are still at work on their diggings. On west side of More Creek the Buena Vista Company having still a good supply of water in the Alderson ditch, are actively carrying on their extensive mining operations on several claims, and Mr. Frank Headen, who procures water from the same ditch, ie, we helieve, also still at work on his claims. Although we were not favored with as much snow during the past winter, as during previous winters, still, owing to the cool weather during the Spring, we have had s better mining season than usual. But few claims have failed to pay, and as a general thing they have paid hetter than ever hefore. We have heard less grumbling and growling than usual, and from all accounts our miners generally are well satisfied with their season's work.

Montana.

MINES AT BUTTE.—*New North West*, July 5: Owing to various causes, not a great deal of work is just at present being done in the Butto Quartz Mines. Mr. Gilchrist some time since reached a depth of 105 ft. in his claim on the Parrott lead, the lead at that point having a 5 ft. crevice of ore, 17 inches of which is the noted rich copper and gold rock. At 90 ft, they struck water. The pay ore had pinched above this, and it was desirable to ascertain if it came in again wide helow water level. So work was continued under many disadvantages, 15 ft. deeper when the streak had widened out again to paying extent and gave evidence of still greater width. As the expense of keeping out the water was heavy and the appliances inadequate, work was therefore suspended until auch appliances could be placed on the mine. That it is a fortune to the owuers, neither they nor miners who have examined it have any doubts. Mr. Gilchrist a few days since sold to Nelson Woverton, of Rocker, a ½ interest in 400 ft, of the Parrott for $1,200.

Mr. Gilchrist also perfected arrangements last week with Mr. W. A. Clark, of the First National, for the further development of the Gamheta lode, which has now a 60 ft. shaft in it, showing at that depth 2 ft. 9 in. of very rich red and black oxide copper ore. It is a more promising lead than the Parrott. Mr. Clark has now a force of men sinking the shaft 10 ft, deeper, and enlarging it to working capacity, which will determine certain negotiations of 1,000 ft. of it, and probahly result in its continuous working. The ore in this 2 ft. 9 in. crevice is worth in San Francisco, for the copper alone, $250 per ton on average. It is designed to make quite a shipment of ore from the lead the present season.

Utah.

PARLEY'S PARK MINE.—Salt Lake *Tribune*, July 3: There are now about 1,000 men working and prospecting in that section of counlry. The Flagstaff Co. have commenced work toward erecting their stamp mill, which will be in running order in abont four weeks. The principal mines are the Ontario, McHenry, Walker, Webster, Pinyon, Pioueer and other claims. New discoveries are numerous and good, among them the Sunny Side stands prominent, at the depth of 55 ft. it having developed a vein four feet in thickness of milling ore, while the Silver Cloud has a similar vein of smelting ore.

BLUE JACKET MINE.—Same, 8th. inst.: A Bingham correspondent saye he visited this mine last week, and found everything in a first rate and promising condition The shaft was down some 43 ft., and has a drift 40 ft. to the north. The ore taken out assays from $60 to $125 per ton, of which there are about 100 tons now lying on the dump, and 150 tons more in sight in the shaft. The foot wall is smooth and well-defined, and there is every indication that the Blue Jacket will become one of the permanent mines of the district.

THE MILLER MINE.—From a private letter we learn that the Miller Mining Co., in American Fork Canon, has struck a new body of gray carbonate ore, large quantities of which are taken out daily. The writer says that all surrounding mines will yield more ore this season than ever hefore.

BINGHAMS'S PROSPECTS.—Salt Lake *Journal*, July 7: Our correspondent, writing from Bingham Canon under date of July 5, says that the prospects of Bingham are most flattering. The mines in this camp will soon be opened sufficiently to allow of more ore being shipped than from all the other camps of Utah combined. That they they have the capacity we can not doubt.

GIANT MINES—A four-foot vein of splendid looking carhonate ore has heen struck in the Little Giant miue. Adjoining this mine is the Big Giant miue, hoth of which are owned hy Messrs. Ferguson and Fuller, and hoth give promise of proving a windfall to the owuers. Work will be pushed ahead on these mines, and to-day a sufficient number of men will be procured to run them day and night.

Time Tests the Merits of all Things.

1840 For Over 30 Years, 1873

PERRY DAVIS'

PAIN-KILLER

Has been tested in every variety of climste, and by almost every nation known to Americens. It is the constant companion and inestimahlo friend of the missionary and the traveler, on the sea or land, and no one should travel on our *Lakes or Rivers without it.*

Since the PAIN-KILLER was first introduced, and met with such extensive sale, many Liuiments, Reliefs, Panaceas, and other Remedies have been offered to the public, but not one of them has attained the truly *enviable standing* of the PAIN-KILLER.

WHY IS THIS SO?

It is because DAVIS' PAIN-KILLER is what it claims to he, a Reliever of Pain.

Its Merits are Unsurpassed.

If you are suffering from Internal Pain, Twenty to Thirty Drops in a Little Water will almost instantly cure you. There is nothing to equal it for

Colic, Cramps, Spasms, Heart-burn, Diarrhea, Dysentery, Flux, Wind in the Bowels, Sour Stomach, Dyspepsia, Sick Headache, &c., &c.

In sections of the country where

Fever and Ague

Prevails, there is no remedy beld in greater esteem. Persons traveling should keep it hy them. A few drops, in water, will prevent sickness or bowel trouhles from change of water.

From foreign countries the calls for PAIN-KILLER are great. It is found to

CURE CHOLERA WHEN ALL OTHER REMEDIES FAIL.

WHEN USED EXTERNALLY, AS A LINIMENT, nothing gives quicker case in Burns, Cuts, Bruises, Sprains, Stings from Insects, and Scalds. It removes the fire, and the wound heals like ordinary sores. Those suffering with RHEUMATISM, GOUT, or NEURALGIA, if not a positive cure, they find the Pain-Killer gives them relief when no other remedy will.

It Gives Instant Relief from Aching Teeth.

Every House-Keeper sbould keep it at hand, and apply it on the first attack of any Pain. It will give satisfactory relief, and save hours of suffering.

Do not trifle with yourselves hy testing untried remedies. Be sure you call for and get the genuine PAIN-KILLER, as many worthless nosirums are attempted to be sold on the great reputation of this valuable medicine. ☞ Directions accompany each hottle.

PRICE—25 cts., 50 cts., and $1 per bottle.

NO LIFE INSURANCE COMPANY has a better record or more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE Co. J. B. Roberts, 315 California Street, San Francisco, is general agent for this Coast. Send to him for circulars and information of this reliable, first-class company.

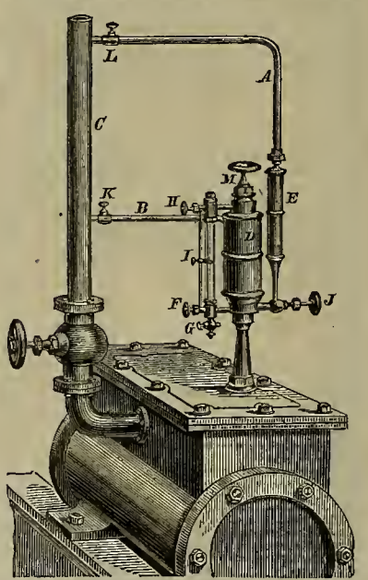
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by the Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condensed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe E into the steam pipe C; it then becomes greasy steam, passes to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

The New Wilson SEWING MACHINE

Has points of superiority over all others. A reliable warranty is given with each machine for

17v26-tf 315 California street, San Francisco.

To Capitalists and Hydraulic Miners.

PATENT SELF-CLEANING SLUICE.

This new and useful invention is designed to collect all the gold as fast as it is set free from the dissolving earth, and conduct it into a receptacle of mercury or safety pocket, under lock and key, from whence it may be removed in a few moments, without either checking the flow of water or interfering in the least with the washing.

This invention, if properly placed in our rivers, will also collect the gold which is yearly traveling down their channels, thus affording an annual income with a trifling expense for attending.

2v25-3m E. G. DENNISTON, Proprietor.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

New Incorporations

California Type Foundry, July 12. Object, to manufacture and sell printing type, printing presses, and printing material and implements connected with the business of printing. Trustees—C. H. Dewey, C. H. Parker, J. Hutchinson, A. Cooper and F. H. McConnell. Capital stock, $100,000, in shares of $100 each.

California College of Dental Surgery, July 12. Object, to instruct in the theory and practice of Dental Surgery, and to confer the degree of D. D. S. on such persons as may be found qualified. Directors—J. A. W. Lundberg, E. T. Bnnnell, J. J. Birge, R. Cutler, James L. Cogswell, Louis Buah and Max Sichel.

The following named company has filed its certificate of incorporation in the Secretary of State's office, Sacramento.

Washington Mining and Transportation Co., July 16.—Objects: Mining and doing a general transportation business in the State of California, Oregon and in Washington Territory, and for constructing a railroad (an electro-magnetic telegraph line in connection therewith), running from a point at or near Tenino to Budd's Inlet, at or near Oylmpia, in Washington Territory, of the length of twenty miles. The principal place of business is to be in San Francisco. Directors: John B. Felton, Theodore Le Roy, Henry Barrollhet, John N. Goodwin, Anson Goldsmith, J. M. Johnson and Edward S. Salomon. Capital stock $1,000,000. The amount of capital stock actually subscribed is $500,000, which the certificate states has been subscribed by the Directors.

Meetings and Elections.

Central Railroad Co. Directors: Reuben Morton, A. W. Bowman, Horace Davis, A. J. Gunnison, Charles Main, George H. Howard, A. J. Pope, Michael Reese and William Scholle. The Directors have chosen the following officers: President, Reuben Morton; Vice-President, A. W. Bowman; Treasurer, A. J. Gunnison; Secretary, N. D. Arnot Jr.

Overman M. Co., July 10. Trustees: George W. Beaver, (President), M. L. McDonald, R. F. Morrow Joseph Clark and O. H. Bogart. W. W. Stetson was re-elected Secretary. No dividends were paid during the year, though there were two or three assessments collected.

California Acclimatizing Society.—July 14. Trustees—W. A. Newell, M. D.; W. W. Taylor, Eureka Consolidated Mining Company; John F. Lohse, California Powder Works; C. R. Merrill, of J. C. Merrill & Co.; A. Gibbon, of J. C. Merrill & Co.; A. E. Swaiu; C. G. Toland, M. D.; P. McGovern; A. McKenzie; F. A. Walton. California Insurance Company; Chas. Kohler, of Kohler & Frohling; Franklin Lawton, Secretary San Francisco Board of Brokers.

Chollar-Potosi M. Co.—July 14. Trustees—A. K. P. Harmon, J. D. Fry, Alpheus Bull, William Norris, H. C. Kihbe, James Freehorn and James H. Dobinson, Secretary, W. E. Dean; Superintendent, Isaac L. Requia.

St. Lawrence M. & M. Co., Placer county, Cal., July 14: Directors.—Francis Avery, (President); Charles Mayne, W. H. Foster Jr., W. H. L. Barnes, and O. H. Bogart; Secretary, Richard B. Noyes; Superintendent, Charles Purdy.

Savage M. Co., July 17.—Trustees: J. H. Pritchard, (President); J. H. Boalt, Robert Sherwood, J. D. Coughlan, and S. A. Raymond; Superintendent, A. C. Hamilton; Secretary, E. B. Holmes.

Washington & Creole M. Co., July 16.—Trustees: G. D. Roberts, M. E. Kelly, T. Fords, T. R. Hayes and A. J. Bowie.

Trench Gold Hill M. Co., July 16.—Directors: H. H. Flagg, (President,) Geo. W. Beaver, James H. Dohinson, W. W. Stetson and Edward F. Stone. Jos. Marks was retained as Secretary.

The Grass Valley *Union* says the Idaho Mining Co met on Monday evening and declared a dividend of $77,500—$25 per share—proceeds of the June run.

A Rich Quartz discovery has been made near San Andreas, Calaveras county. The ledge is one foot wide.

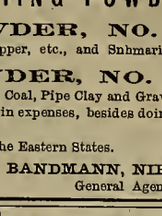
A Good Bindsr for $1.50.

Subscribers for this journal can obtain our Paten Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be used for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the Press. lambp

Purchasers please say advertised in Scientific Press.

Ashcroft's Patent Steam Gauges,

(Original—with Bourdon Spring).



Steam Gauges,
Vacuum Gauges,
Registering Gauges,
Test Gauges.

Low Water Alarms, Gauge Cocks, Glass Water Gaugee, Cylinder Cups, Self-Oilers, Boiler Felting, Selden's, Tuck's, Hemp and Soapstone Packing, Stocks, Tape and Dies, Twist Drills, Drill, Lathe and Planer Chucks, Emery Wheels, Etc.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Enginssrs, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

Eureka, Nevada, July 10, 1872.

T. M. Martin My dear Sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, C. C. GOODWIN.

Emma Hill Consolidated Mining Co., Little Cottonwood, Utah, Superintendent's Office, Sept. 29, 1872.

T. M. Martin, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

W. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as nicely and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, San Francisco.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 113 and 115 Pine St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

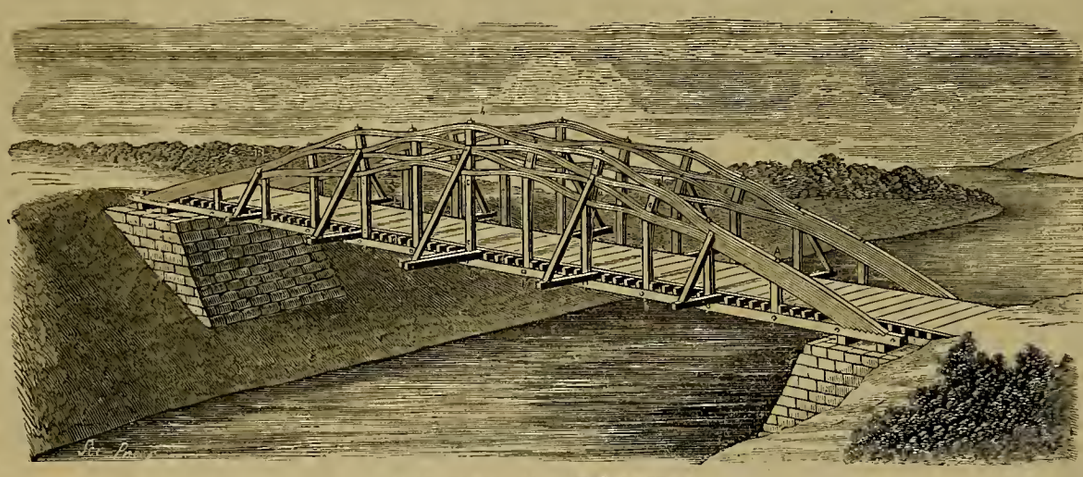
SAN FRANCISCO, SATURDAY, JULY 26, 1873.

VOLUME XXVII. Number 4.

An Improved Truss Bridge.

We herewith present an illustration of a new style of bridge truss, a patent for which has been recently secured through the SCIENTIFIC PRESS Patent Agency. The patentee is a civil engineer in this State. We have heard no name proposed for this truss, but the terms "Serpentine," or "Alternating," suggest themselves. The principal feature of novelty in this invention consists in the fact that certain portions of the truss are made to perform two separate functions, and yet are required to be only strong enough to perform the principal one. This may seem at first a paradoxical statement, but its correctness will he seen hy reading this description.

Before proceeding further, it may he well to analyze very briefly the elements of a truss, such as the Howe or any other into which the suspension principle does not enter. A truss consists of (1st) a top chord or beam, running nearly or quite the entire length of the span. The strains on it are of compression or from the ends towards the middle; (2d) a bottom chord extending the entire length of the span, and sustaining tensile strain, or the reverse of the top chord; (3d) a series of ties and diagonal braces between the chords. The main object of these is to convert vertical strains into horizontal ones and transfer them to the chords. In the Howe, the braces are inclined towards the ends; these prevent distortion. Without them the truss, when loaded at any particular point, would rise on each side of the load, and consequently he much weakened. Counter braces are required to he stronger and heavier as the middle of the bridge is approached. These braces and counters, ties, etc., are called "web members,"



NEW FORM OF TRUSS BRIDGE.

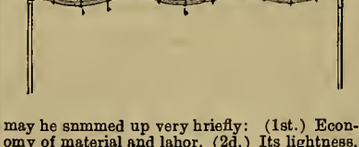
From the foregoing it will he seen that there is a limit to the span of a truss bridge, on account of the immense load of "web members" which a long span has to carry. It will also he seen that the chords have to increase in size and strength. Therefore the weight of a bridge does not increase as the length, but in a constantly-increasing ratio to the length itself; and after passing a certain limit of span, the bridge becomes so heavily-loaded with its own dead weight that it has no reserve strength to bear working loads. We will now pass to the consideration of the serpentine or alternating truss.

This invention consists essentially of a method of alternately uniting and separating a series of timbers into curved openings or bays. Two timbers for instance, may he firmly united in the middle and at the ends, and then strained apart at the intermediate points, making two bays. They may he carried into any number of bays, and another pair of timbers of the same or less length, but with similar openings may he placed on top; and the whole firmly united together, all timbers being properly keyed at the points of tangency. By this means it is apparent that the power of the timbers composing a bay, to resist a vertical strain, either upward or downward, is increased. It is also evident that their power to resist tensile or compressive strain is in no respect diminished—it being granted that the timbers are thick enough or are so secure, that distortion in a vertical plane cannot take place. Therefore the statement at the beginning of this article holds good, and the same parts may perform two different offices and yet need only he strong enough to perform the more severe one. Further; these openings may he of variable lengths; longer in one portion of a structure, and shorter in another; thus allowing an economical distribution of material. The individual timbers may also begin and end very nearly where the proportions of the structure demand, which is another feature of economy. The truss may he executed in wood or iron. The illustrations given, show only the application to wooden structures.

The larger engraving exhibits the general design of a bridge of 150 feet span, some of the minor details, common to all bridges, being omitted for the sake of simplicity. The design is an adaptation of the new method to a "bow-string" truss. The top chord is made, as arched chords generally are, hy placing several timbers or pieces, one on the top of the other, so that the greatest dimension of transverse section of each shall he horizontal. At any points demanded hy the proportions, *A* and *B* for instance, these timbers are separated and a strut inserted, half the timbers being on each side. Portions of these timbers are brought together again to make the first bay, while the top and bottom timbers are further separated to make the next two bays. This alternate opening and closing is continued through the length of the chord, the struts, *a a*, being disposed as shown, and longer struts placed under them and connecting the top and bottom chords. The screw bolts or suspension rods, *b b*, run entirely through, sustaining the load on the bridge and holding all the timbers firmly in place. The top chord may he braced laterally in the usual manner, hy ontside braces, c c, resting at their feet on floor beams extended for that purpose. The floor timbers are shown at *d d*, Now as to the effect of a load on the bridge.

A "bow-string" truss, which is uniformly loaded throughout its entire length will settle equally, there will he no distortion, and counter-bracing is not needed. Therefore it will he necessary to discuss only the effect of a local or moving load on the truss. Suppose the load occurs at any particular part of the truss, say the middle of it; the strain is carried hy the suspension rods and given to the upward curves of the bays over the load. Any upward thrust on either side of the load, which is usually met hy counter-braces, is amply resisted hy the downward curves in the adjacent openings. Thus the necessity of counter-braces between the chords is obviated. Not the least item of excellence in this method of composing timbers is that the system is compensating; that is to say, if the timbers of any bay are defective or weaker than the average, their tendency is to open with a compressive strain; that crowds those of the bay above or below closer together, thus lengthening them out and distributing the strain and relieving the weak portions. Neither are perfect joints so essential to this bridge as to others. In some trusses one imperfect joint will render useless one-fifth of the material of the chord and endanger the safety of the structure; or—going farther—it may he like a defective link in a chain; for a chain is no stronger than its weakest link. In this truss the timbers cannot but come to an even bearing and the work will he allotted to each portion according to its strength. When the bridge settles from use, the camber can he restored hy simply shortening the opening struts and drawing up on the rods.

The smaller engraving, shown beneath, presents a section of a roof truss of 75 feet span, with a rise of five or six feet in the middle. The struts, *a a*, are more numerous in this than the other, additional ones being inserted where the curves change from direct to reversed. The purlins, c c, are placed over struts and the tie-bolts, o o, pass through them and the truss, firmly securing the whole. The rafters and covering are represented at *d d*. A long tie-rod might he passed lengthwise through the tangent points of the lower openings from end to end of the truss. A roof truss more economical in material and space it would he difficult to design. The main features of excellence for which this method commends itself



may he summed up very briefly: (1st.) Economy of material and labor. (2d.) Its lightness, which allows increased span.

We may have occasion to refer to this subject again and present some other designs. The system admits of such a variety of forms and has so many adaptations that space forbids the exhibition of but a small portion at a time.

ALTA, Little Cottonwood, Utah, is excited over the fact that some parties in Salt Lake City hold a United States patent for the land on which the town is situated. If the parties holding this patent are unscrupulous speculators, it will he trouhlesome for Altaites; but if they are sensible men, they will deal honestly and fairly with the people of the town. If they put on the screws too heavily, however, the people of Alta had better take their town bodily, and move to some other locality near hy. As it is pretty high up in the mountains, they will have a down grade to move on, which is one advantage.

Academy of Sciences.

The regular semi-monthly meeting of the California Academy of Science, was held on Monday evening last. Professor Davidson in the chair. Messrs. D. O. Mills and H. H. Moore were elected life members, and J. C. Horner de Tavel and A Gros, resident members. A collection of fossil shells from an altitude of 800 feet on Cerros Island, off the Lower California coast, was presented by Lieut. Commander C. W. Kennedy. Capt. Wm. Hotzgar, presented several small lobsters from Magdalena Bay; also specimens of the nautilus. From C. A. Wetmore, specimens of pottery, fibre and twine, from the ancient graves of the Incas, in Peru. Specimens of paper manufactured from wood were donated hy Alexander Austin. A number of very handsome views of the Yellowstone country were exhibited hy the President.

Mr. Henry G. Hanks presented samples of cuproscheelite; described the mineral fully; it is referred to in another column of this issue.

Professor Davidson exhibited drawings and described in detail the construction and application of an improved telemeter. We will probably give an extended description and illustration of the improved instrument in a future issue of the PRESS.

A deed was read hy the President by which James Lick conveyed to the Academy 40 feet front adjoining the property already given hy him. This makes the whole gift 120 feet hy 275 feet of ground on Market street, in one of the most desirable locations in the city. The property is estimated as being worth about $250,000.

Dr. Hewston moved that the President and Trustees be authorized to receive the additional donation of James Lick and return the thanks of the Academy. The motion was carried unanimously.

Dr. Stearns submitted for publication two papers on the Shells of Lower California.

C. A. Wetmore explained the peculiarities of a collection of skulls taken from the ancient graves of Peru, on the eastern slope of the Andes.

Dr. Stearns announced the death of Colonel John W. Foster, President of the Geological Society of Chicago, and an eminent American scientist. On motion, Dr. Stearns was appointed to prepare resolutions appropriate to the event.

THE INTERNATIONAL MILL at White Pine, which was destroyed hy fire some time since, is being rebuilt hy the Eberhardt & Aurora Mining Company. This mill had 60 stamps, 30 crushing dry and 30 wet. It was complete in every respect and cost a fortune to build. The new mill will have 30 stamps. The machinery injured hy the fire is being repaired and will he used again.

SECRETARY DELANO has decided against the squatters in the Eureka mining case; also that in the six days wherein is granted the time to give notice of adverse claim, the first and last days are inclusive.

THE adverse claim to the application of the Tiger Silver Mining Company for a patent to the Tiger Lode in Arizona, has been rejected hy Commissioner Drummond.

CORRESPONDENCE.

Notes of Travel in Eureka County, Nevada.

[By Our Traveling Correspondent.]

Eureka.

In my last, I gave you a screp of the eerly history of this plece; since writing, I find e great many differing as to dets, and some few as to the nsmes of the eerly Pioneers of the plsce. I venture to sey that there are a great meny humble miners who had no title of Col. or Capt. to thsir names in thet dey, nor even now, whoss history, if known and writtsn, would make an interesting volums.

A little of what exists here besidss mining, mey not be uninteresting, so I will mention first,

The Climate

Of this section of Nevada is not as severe as one would suppose. During ths pest four winters, the thermometer never but once wes as low as —2°, (the lowest point reached last winter was 6°) and in the summer not ebove 85° or 88°. The winter hegins late and consequently "lingers in the lap of spriug." On Prospect mountain snow falls three or four feet deep, diseppearing entirely in May or June. In the valley it is seldom over six or eight inches deep, and remeins but a short time.

Rain falls tolerably regularly in Spring (April or May) and summer (July and August); often in summer accompanied with much thunder and lightning. The grazing on the mountains, and in the valleys in ordinary years is excellent, hut the almost total ahsence of the usual spring rains, gives the couutry just now a rather desolate appearance.

Botanical.

To the Californian, in his land of flowers, accustomed to hear Nevada spoken of only as a sage brush desert, the idea of dilating on the varieties of flowers here might seem ridiculous; but I am assured by an old resident that there are in ordinary seasons great numbers of flowers, insects and birds. My friend has known of a bouquet containing some sixty-eight different kinds of wild flowers, gathered on the Sacramento plains, and he assnree me that he gathered a bouquet containing twenty-seven different kinds of wild flowers, while going to the mines a short distance from home, among which were roses, fleur de lis, cineraria, phlox, tulips, campanella, Indian pink, batch-elor's button, daisy, larkspur, wild pea, end others whose names were unknown to him, and that with a little care, not less than forty or fifty kinds could be found, end this in tbe dryest of all seasons. Tbe foliage of some of the smaller shrubs and grasses is beautiful and very delicate.

Ornithology.

Flowers attract insects, and insects attract to the district many varieties of birds, snch as larks, robins, mocking-birds, catbirds, blackbirds, oreoles, wrens, and besides many of the smaller ground birds and wood warblers, and above all that splendid singer Audubon's warbler, who sings for honrs, both day and night, known all over Nevada.

During the summer months, the wind blows regularly from the south, often bringing with it along the travelled rontes clouds of dust, but this is only near the roads, and is not felt off the line of travel.

Fruits and Vegetables.

Fruit trees of the hardier kinds might be raised to advantage, as there is nothing in the climate to prevent it, but so far no attempt has been made. Vegetables of all common kinds are raised in the towns by the Chinese, and on the ranches in the vicinity. Potatoes, especially, grow finely. Mr. Chas. Bray raised and exhibited here potatoes grown on his ranch (the Cottonwoods) last year, as fine both as to size and quality as can be produced anywhere.

All of this goes to show that with time and care all snch necesseries of life could be raised here, and many pleasant and comforteble homes be built up, even in the sage brush wilds of Nevada.

Eureka Cons. M. Co.

So much has been written and said about this corporation, that it will be herdly necessary to go into detail or mention anyone connected with it, except tbe active officers: A. M. Ellsworth Esq., is the General Superintendent, and M. Lamb, Mining Foreman. Tbe mine of this company is located nearly south of the town of Eureka, and distant about two miles, on what is known as Ruby Hill. The possessions of tbis Company are bounded by those of other corporations as follows: The K. K. Min. Co., on their southeast; and the Richmond M. Co., (Limited), on their northwest. The ore body of this compeny runs in a direction bearing a little north of west by south of east.

Present Development

Is being made through two principel shafts, eech of two compartments and known es the Windsail and Lewton shafts, both vertical, and the depths of which ars: Windsail, 255 feet, and Lewton, 300 feet. This latter sheft hes 4 levels, commencing from the top. The 1st level is 74 feet from the surfacs and is run in a southwesterly course a distance of 630 feet, and cross-cut 150 feet eddltional. The 2nd level is 170 feet from the surface, runs a north of west course, end is in 360 feet; 520 feet of cross-cuts heve been run on this level. The 3d level is 220 feet from the surface, runs in a northerly direction, and is in 310 feet, and has 220 feet of cross-cuts. Tbe 4th level is at the bottom of this sbaft, 300 feet from the surfece, runs south of west, in 220 feet, and is cross-cut 230 feet more.

The Windsail Shaft.

Tbis sheft has four lsvels, celculated on a bsse line bowever, from ths Lawton shaft, altbough tbe top of this sheft is 53 fest more of elevation, which must be added to the calculetion below the surface. The 1st level is 28 feet down, end run in 70 feet; the 2nd level is down 88 feet, end run in 95 feet; the 3d level is down 140 feet, and in 55 feet; the 4th level is down 202 feet, and in 160 feet. Tbe generel course of the ore hody in tbis company's mines is nortwest by southeast, and in some places where they are now extracting ore, the pay-streak is 50 feet wide, end they do not know how much wider. The extent of

Mining Ground Claimed

By this corporation, by location and purchase, is about 90 acres, or 1,480 feet long hy 910 feet wide, the most of which is covered by U. S. Patent. Tbey own 14 locations, ths following of which ars the principal ones: Buckeys, Champion, Savage, Lewiston, Mammoth, At Last, Margarite, Lupita, Elliptic and Triaugle. I neglected to state that they have still another shaft, besides the two ahove mentioned, called the "Buckeye," a whim-shaft, (the other two have fine steam hoisting works over them.) This sbaft is 170 feet deep and has 3 levels; the 1st one is down 100 feet, and in 240 feet, running east; the 2d level is down 125 feet, runs west and is in 120 feet; the 3d level starts in at a point 129 feet from the surface and is in 90 feet in a northeasterly direction. I would edd further that a tunnel connects tbe 74-foot level in the Lawton sbaft, with the ore shutes, so no ore is raieed to the top of the shaft.

Ore Extracted.

The numher of tons of ore extracted daily from this mine varies, but averages about 100 tons, which also vary in velue, hut average about $35 per ton. Tbey employ about 200 men on an average, the wages of whom are: Miners $4 per day, timber carpenters $4.50, emelters $4.50, engineers $5 to $6, carpenters from $5 to $8, which schedule of prices paid for wages, is the same in the rest of tbis district. The ore is hauled by contract from the mine to the furnaces, and costs $2 per ton. This company's furnaces, or

Smelting Works,

Are located in the lower part of the town of Eureka, about 2 miles distant from the mines. These works have 5 first-class furneces, two of which are in constant operation, driven by a 50-horee power engine, connected with three 54-inch boilers, all of which have been thoroughly overhauled, together with the furnaces, engine, and several new appliances, and one new main shaft, since Mr. Ellsworth, the present Superintendent, took charge of the company's works; add to the above 1 Blake rock-breaker, 5 Sturtevant blowers and one splendid steam pump, to be used in case of fire, and you have as complete a working furnace as there is in this camp. A machine shop is connected with these works for doing their own repairing, driven by a separate engine. A first-class lathe, with all the usuel appliances, is to be found in their shop. Tbe furnacee of tbis company are able to smelt abont 40 tons of ore eacb, daily, turning out from 5 to 8 tons of bullion each, every 24 honrs. Tbe company turn ont from 312 to 543 tons of bullion monthly, that is worth in gold, silver and lead, about $400 per ton.

The Adams Hill Mine,

A fine property, is at present lying idle, although cousidered here among the first-class mines of tbis district. They have fine hoisting works, and one main shaft down 257 feet, all the way in ore thet will averege from $60 to $80 per ton in silver and gold, about 600 tons of which are now on the company's dumps. I could obtain no particulars as to when they intended to again start up.

Richmond Mining Co. (of Nevada),

Located on Ruby Hill, about 2¼ miles in a northwesterly direction from the town of Eureka, Nev., J. J. Corrigan, Pres.; Trnstees —J. B. McGee, Tbos. Wren and J. J. Corrigan; J. B. McGee, General Supt. Incorporated in February of this year.

Tbis mine was one of the first claims worked after this district became known, the history of which is a long story, and probably uninteresting to your readers. Suffice it to say, tbat it is what was known as the "Richmond Consolidated M. Co." and formerly owned by Ogden, Dunn & Co., of Eureka, Nev., and has been worked successfully by different managements, since the year 1870.

Mining Ground Owned

Consists of the following locations, obtained by purchase end otherwise, viz: The Richmond; Virginia; Look-out; Colorado; Silver Region and Tip-Top, making an eggregate of about 5,000 feet of ledges.

The ledges, or ors bodies, havs the same general courss as all others on the hill, i. e., northwest by southeast. The general character of the country rock is limestone; the ore found is bass, carrying silver, gold and leed, and pays about $50 per ton in silver and gold, and runs about 25 per cent. lead. This mine hes hed en immense amount of lahor performed upon it since my visit here one year ago. The

Tunnels, Shafts, &c.,

Coustituting the present developmeut are as follows: One tunnel, now in ebout 400 feet, running through the lime cap, end now witbin 50 feet of the ors body. This tunnel will be, when completed, 550 feet in length, and will terminete at what is known as the Look-out sheft, which shaft is down vertically 280 feet, and in ore. Their principal shaft is an incline, down about 400 feet, on au angle of 35°. From this incline sheft some 500 feet of cross-cutting has been mede; tbis incline shaft is distant about 400 feet from the Look-out, and about 300 fcet of that distance has besn mined out, exposing the largest ore body in the world—outside of the Comstock lode.

An Immense Ledge.

That portion of this mine already worked out, shows that an ors body 250 feet wide, and from 30 to 80 feet thick exists. This same ore body is still facing them, end even larger, now, thsn that portion teken out. By way of quotation, I see in e recent number of ths London *Mining Journal*, that, by en estimate made by Clarencs King, there is ore enough in sight in this mins to produce $3,500,000 worth of bullion, or, in their languege, seven hundred thousand ponnds sterling. Tbis company ars employing at their mine, about 60 men, night end day; and ars extracting about 100 tons of ore daily. This ors is hauled by contract from the mine, at $2.50 per ton, to

The Company's Furnaces,

Located in the upper portion of the town of Eureka, and distant from the mine, (as above stated) 2½ miles.

This corporation's smelting works consist of two large furnaces, that have a capacity of reducing 80 tons of ore every 24 hours, working 35 men in ell departments. Tbe engine, blowers, rock-breaker, and all the usual appliances used around a furnace, are in use here; many new ideas and improvements have been introduced here since my last visit, all of which are meritorious; but time and space forbid special attention of each at this time. In addition to furnishing ore for tbeir own furnaces, they are baving about 45 tons of ore per day reduced at the Hoosac Smelting Works, using some of their surplus ore now on hand to supply both

Coal and Wood.

This company use about 3½ cords of wood, and 2,200 bnshels of charcoal deily, to run their furnaces. Wood is worth per cord (by contract) $6.50, and charcoal 28 cts. per bushel. The consumption at this furnace is 1,277 cords of wood, and 804,000 bushels of charcoal. The average production of base bullion at tbis Company's furnaces is 435 tons monthly, and including tbe bullion mede by the Hoosac Works, it will run 650 tons monthly, worth about $300 per ton, about $240 of wbich is silver and gold.

Industry Mine.

Tbis mine, located on the east side of Prospect mountain a little west of south from Eureka, and distant about 4 miles, is owned by five partners; M. P. Murphy, owning one-third, and the following named gentlemen owning a sixth interest each: J. W. Sullivan, James Miley, Laurence Hartnett and Donald Fraser. Mr. Murphy is Acting Superintendent. These gentlemen claim 1,000 feet of a ledge, or ore body, running north and soutb, aud dipping to the west. The character of the country rock is limestone on both sides. At present tbis claim is lying idle, but the

Previous Development

Consisted of 3 shafts sunk to depths varying from 10 to 45 feet, and three open cuts, two of which run to two of the shafts. By the above mentioned development, an ore body apparently continuous was found, varying in width from 4 to 10 feet. A tnnnel has also been run into this mine, at a higher point on the bill, in which, some 14 feet from the surface, an ore body 4 feet tbick is found. This company have had 5 tons of ore worked at tbe Richmond furnace, that paid a little over $70 per ton, and 6 tons worked at the Lemon mill paid $90 per ton, and 25 tons just worked at the Ruby Consolidated furnace paid $83 per ton. The ahove tests and development show a very flattering prospect. A full force of men will be put upon this mine, before this appears in print, with night and day sbifts. You may expect something more flattering from this mine, shortly. They have about 70 tons of fine ore on their dumps at tbis writing.

Charcoal Producers.

The production of charcoal in this section of the country, is an extensive one, and wortby of notice. Some 8 differeut contractors are engaged in coal-burning here, and employ about 1,000 men, producing about 2,000,000 bushels annually. Messrs. Wbisler & Reilly furnish about 1,250,000 bushels of that amount, employ about 400 men, and bring into requisition some 200 yolk of oxen. L. P. MC.

[Concluded next week]

MILLING AT MINERAL HILL.—We have received the following letter from Mr. H. H. Oakes, Superintendent of the mill of the mineral Hill Silver Mines Company, which expleins itself:

EDITORS MINING AND SCIENTIFIC PRESS:—I notice in your interesting paper of the 12th inst. under "Notes of Travel iu Eureke and Elko Counties, Nevede," by your travelling Correspondent, thet makes meution of the high price charged for reducing ores by the Custom Mills, wbich he understands is $35 per ton. As there is no other Custom Mill in the immediate neighborhood of Mineral Hill, I concluded bis remarks referred to the mill of tbe Minerel Hill Silver Mines Compeny.

As his statsment is apt to misleed the public who mey have ores to work, will you allow me spacs in your veluable paper to say, thet tbs price cbarged for reducing ores at the mill of my Company, is now, (as it alweys bas been,) $30 per ton; returning to the owners of tbe ore, from 80 to 84 per cent. of the essey value according to the grade of ore worked. I don't think any one can cell tbis an unreasoneble charge. I venture to say, thsre is not a mill in the State which will work custom ores at a lower figure.

I am Dear Sir, yours most obediently,
H. H. OAKES, Supt.

Mount Diablo Coal Mines.

A correspondent of the *Call* writes as follows from Somersvills: At Somersville are situated the Union, Independent, Eureka and Pittsburgh mines. The latter company have recently purchesed the Independent end Eureka, and are busily engaged in repairing sbafts, tnnnels and machinery, preparatory to working them—thess two mines having been idle for some time. In the Superintendent of tbe Pittsburgh, Mr. C. W. Clarke, I recognized an old Tuolumne acquaintance. As the foremsn, Mr. J. H. Smitb, was about making his morning round of inspection, I accepted his invitation to accompany him. Donning a mining suit, and placiug one of the little coffee-pot-like lamps on my head, I descended the slope in a car. The air seemed to be very close on arriving at the first level, and I was cautioned about walking too fast. The first gangway we entered was about 1,100 feet long; we started at a slow walk to traverse this distance. A small railroad track is leid the whole length. After progressing about two hundred feet a faint rumbling noise wes heard, growing more distinct each moment. Mr. Smith informed me that it was one of the small coal cars coming, and pointed out a little niche in the rocky well for us to stand in while it passed. Tbe cars run on a geutle down grade, and each one is accompanied by a young man, called a "car runner." On came the car, and soon a faint light appeared in tbe darkness, growing more distinct as it approached. I flattened myself as much as possible egainst the wall, and noticed that I had just tbree inches to spare as the car went wbizzing by, with its "car-runner" perched on the rear end, looking, for all the world, with his head-light on, like a veritable imp of darkness. We passed three of these "flying devils" before we reached the end of the tunnel, or gangway, as they are called in coal mines. I noticed wide spouts or "shutes," ae we pessed along, and upon inquiry, their use was explained to me. At a distance of about fifty feet from tbe slope, the first "shute" is put in and numbered No. 1, and so on at eecb fifty feet the whole length of the gangway. As thie gangway was about 1,100 feet long it contained twenty-two "shutes." The gangway runs parallel with the length of the vein. It is about six feet square. The veiu of coal being only about three and a half feet thick, the miner neceesarily has to cut out from three to four feet of eand-rock on the bottom of the gangway, on which is laid the car track. The coal veiu pitches at an angle of thirty degrees, and when a "sbute" is put in the coal is cnt out to the width of about five feet and the tbickness of the vein; a wooden trough five feet wide, about one foot in depth, and several feet in lengtb, with sbeet-iron on the bottom, is inserted. The miner then extends thie opening in a streight line, following the pitch of the vein to the next gangway, tbus securiug an air passage. He then commences taking out the coal on each side of him for about fifteen feet, and leaving a strip some twenty feet wide between the "shutes" for supports. In this space of three or four feet in height tbe miner crawls. and, either sitting or lying down, works out the coal with a pick. The cars pass along under tbe ends of the "shutes," which project a little into the gangway, and receive their load of coal.

In taking out the pillars of coal, when they are of no further nse, great care is used to prevent accidents, and soon the lower ledge of sand-rock swells and closes up the space from which the coal has been taken. The foreman is extremely careful in sending his men to do this work, and in the ten years that this mine has been worked but three men have been killed. The Pittsburgh Company employs 160 men, and are averaging about 4,000 tons of coal per month. The Union, superintended by H. S. Hawxhurst, employs about 100 men. The coal from these two mines is transported by railroad to Pittsburgh Landing on the San Joaquin river, a few miles below Antioch. The Central Company's mine is eituated about half a mile southeaet of Somersville. A large portion of the stock of tbis company is owned by Messrs. Shattuck & Hillegase, of Oakland. Mr. Stewart is the Snperintendent. The coal is transported by teams to Antioch.

MECHANICAL PROGRESS.

Ancient Construction.

Mass was the predominant feature of ancient constructions, and clay, earth, bricks and stones, the principal materials. The introduction of the arch or vault was one of the earlest substitutions of the hollow for the solid. If a solid, massive, square pillar have the middle portion cut out and an arch turned over the top, there is so much of the original mass removed, and a new style of construction, so to call it, introduced. It has been generally admitted that the invention of the arch is due to the Romans, yet there can be very little doubt but that the Assyrians were thoroughly acquainted with it, although clay in some shape or another constituted almost their sole constructive material. This formed the nucleus of the enormous artificial mounds which that people were fond of raising on which to erect their palaces, citadels, and other commanding buildings. Instead of excavating foundations upon which to build, an artificial foundation was raised and the superstructure placed thereon.

Modern works are now conducted on a scale so gigantic that we are pretty well accustomed to immense shifts of earth; but mechanical appliances are at our command which were unknown to our predecessors, who used neither wagons nor barrows, but hand labour only in its simplest form. In the erection of the artificial mounds to which we have alluded, the Assyrians were not in the habit of using the clay at random, but mixed and prepared it with great care, so that it showed a uniform section everywhere when cut. It was completely free from stones and all foreign bodies, and closely resembled in its consistency the best modern puddle. This material is now in numerous instances giving way to concrete, which promises fair to be to us what the clay and bricks were to the ancients. In work of a character similar to the Thames Embankment the quantity of concrete used in foundations and backing is something enormous.

Explorations at Nineveh have shown that except for paving purposes stone rarely entered into the construction of the walls and buildings. They consisted of clay only, which had evidently been moulded in the shape of bricks, and put together without the aid of mortar or cement of any kind. In the few examples in which stone was found to be employed the joints were made in the same manner, that is, by simple juxtaposition. Mortar and cement appear to have been rarely or never employed. The size of the stones was considerable, so that mere weight would, to some extent, render superfluous the employment of any adhesive substance at the joints. But this was not the case with the bricks, which were nearly of a square form, 1ft. 4in. on the sides by 2in. in thickness.

The question which remains unsettled is, in what degree of consistency were these bricks at the time they were put together? Were they sufficiently plastic to adhere together, or were they wetted before being used, so as to soften the surfaces merely which were in contact? Upon this supposition there would be an appreciable difference between the appearance of the body of the bricks and that of the joints, which does not exist. There is, nevertheless, a slight difference in colour at these points, which looks like lines.

The Assyrians have two varieties of baked bricks: the one was regularly shaped, with parallel faces, and the other of a trapezoidal form. These latter were intended for arches or vaults, and the inclination of the sides varied with the position which the particular brick was intended to occupy in the curve.

The dimensions and proportions of the Assyrian bricks differ from those of modern manufacture. Those employed in paving were of two sizes. One class was 1ft. 4in. by 1ft. 4in. by 2½in. in thickness, and the other 13in. by 13in. by 4½in. thick. A peculiar feature in these old bricks is that they are with few exceptions covered with inscriptions in the cuneiform character. Two remarkable features in the construction of ancient cities were, first, that either the diagonals or the direction of the sides pointed exactly towards the cardinal points, and, secondly, the enormous thickness of the walls of the principal buildings. It is probable that astronomical reasons dictated the former of these, and climatic exigencies the latter. In the case of Nineveh there can be little doubt of this, as the Assyrians were noted for their skill in astronomy, and their partiality for the science. The thickness of the internal walls is scarcely ever less than 10 ft., and that of some of the external varies from 16ft. to 25ft. Some consideration must be given to the fact, with regard to the thickness of the walls, that the mode of building them with bricks merely dried in the sun required this dimension to be disproportionately great.

In the building of their domes and vaults the Assyrians employed a more brittle description of brick than in their walls and pavements, and the joints were made by grouting them with semi-fluid clay. The voussoir shape of these bricks proves that the theory of the arch must have been known at the time, and some considerable progress made in the preparation of artificial stones. There is no evidence of timber being employed as a material of construction by the people under notice. It was used only in small quantities, and for the purposes of ornament. It seems that iron was altogether unknown as a constructive material. Copper was turned to account for the pivots or hinges of doors, and lead was also rendered serviceable. Enamelled bricks were common, and stucco was largely employed, as with us, for the double purpose of protecting the brickwork from the effects of the air, and hiding the roughness of the surface.

There is one ceremony which appears to have existed at the time of the Assyrians, which is common to modern times as well. It is that of laying the first, or foundation-stone of a building. A recent French explorer, M. P. Place, discovered in a layer of fine sand underneath one of the monoliths of the gates of Nineveh a variety of different objects in marble, agate and cornelian, which were cut and engraved, and were, moreover, all pierced with a hole, as if they had originally formed part of a bracelet or necklace deposited at the laying of the stone, as coins are deposited with us. While well versed in the practice of earthwork, brickwork, and even masonry, the Assyrians were totally ignorant of the art of construction considered in the light of an assemblage of pieces of timber or iron. They could heap up materials so as to cause the structure so composed to resist any outward force by its sheer weight or inertia, but they knew nothing whatever of the distribution of pressures, or how to proportion a structure so that it should be equally strong in all parts. Both the labour and the material were too abundant to call for economy in either one or the other.—*Engineer.*

Safety Lamps in Mines.

Some valuable researches on the conditions under which safety-lamps are truly safe have been conducted by Mr. R. Galloway, partly at the new Laboratories at South Kensington and partly at the Meteorological Office. Mr. Galloway has already found that if a Davy lamp be burning tranquilly in an explosive atmosphere, the transmission of a sound wave, produced by a slight explosion of gunpowder, is sufficient to determine the communication of flame from the lamp to the surrounding atmosphere. Hitherto it has been generally assumed that the occurrence of a colliery explosion, after firing a shot, is due to actual communication of flame from the gun powder to the fire-damp; but Mr. Galloway's experiments show that it is much more likely that the explosion is determined by the noise of the shot being propagated through the galleries of the mine to the safety-lamps. An admirable experiment to illustrate this point was exhibited by Dr. W. Spottiswoode at a recent lecture at the Royal Institution. A lighted Davy lamp was surrounded by streams of coal gas issuing from a number of jets round the base of the lamp. One extremity of a long tin tube, open at both ends, was placed in connection with the lamp, while a pistol was fired at the other end, a caoutchouc diaphragm being interposed in the tube to prevent the transmission of a direct current of air. The sound-wave, generated by the report, travelled along the tube, and as soon as it reached the flame, caused ignition of the surrounding atmosphere—the lamp being immediately enveloped in flames.

A NOVEL RAILROAD STOVE. — A fire proof-stove for use in passenger cars especially, was subjected to a severe test in Boston, recently. The stove is made of wrought and malleable iron. It is circular in form, composed of three upright cylinders and two cold air boxes at the bottom. The fuel is placed in the inner cylinder. The cold air rushing through the cold air boxes drives hot air outward and upward through the cylinders, the rounded form giving a very powerful radiation. The heat escapes through a register in the back. The whole is firmly bound together by strong iron bolts. The doors are fastened by patent locks. At the trial, the stove, after the fire in it was well under way, was thrown from the staging upon which it was placed, to the ground, a distance of six feet. It was then rolled about, and tumbled over and over, but not a spark of the fire was spilled upon the shavings which were scattered around. When the stove-door was opened, the fire was burning briskly. The ingenious apparatus was invented and manufactured in Wilmington, Delaware, and it is believed its general introduction would prevent the supplemental fires which so generally follow railroad accidents where stoves are used in the cars, and which frequently cause almost as great a loss of life as the original break down.

STATION ANNOUNCER.—In every car on the Connecticut River railroad there is a box overhead at one end in which is contained the name of the next station, which it is the duty of the brakemen to change as they leave the stations. It also states where they connect with other roads. As the change is made, a bell strikes twice, which attracts the attention of the passengers, so that the box always exhibits the name of the next station, and so on. Thus passengers always know the name of the stopping-place, and also if it connects with any other railroad.

TO DISTINGUISH IRON FROM STEEL.—An English engineer says that a good method to determine between steel and iron is to burn filings of the samples in a flame, as steel would scintilate, while iron would burn quietly.

SCIENTIFIC PROGRESS.

Sympathetic Vibrations in Machinery.

The vibrations I propose to demonstrate are those which are pitched so low as not to come within the limits of human ears, but which are felt rather than heard. I wish to show how these may be seen as well as felt.

All structures, large or small, simple or complex, have a definite rate of vibration, depending on their materials, size and shape, and as fixed as the fundamental note of a musical chord. They may also vibrate in parts, as the chord does, and thus be capable of various increasing rates of vibration, which constitute their harmonics. If one body vibrates, all others in the neighborhood will respond, if the rate of vibration in the first agrees with their own principal or secondary rates of vibration, even when no more substantial bond than the air unites this body with its neighbors. In this way mechanical disturbances, harmless in their origin, assume a troublesome and perhaps a dangerous character, when they enter bodies which are only too ready to move at the required rate, sometimes even beyond the sphere of their stability.

At one time considerable annoyance was experienced in a cotton mill because the walls and floors of the building were so violently shaken by the machinery; so much so, that, on certain days a pail of water would be nearly emptied of its contents, while, on other days, all was quiet. Upon investigation it appeared that the building shook in response to the machinery only when it moved at a particular rate, coinciding with one of the harmonics of the structure; and the simple remedy was to make the machinery move at a little greater or a little less speed, so as to put it out of tune with the building.

We can easily believe that, in many cases, these violent vibrations will loosen the cement and derange the parts of a building, so that it may afterwards fall under the pressure of a weight which otherwise it was fully able to bear, and at a time, possibly, when the machinery is not in motion. Large trees are uprooted in gales of wind, because the wind comes in gusts; and if these gusts happen to be timed in accordance with the natural swing of the tree, the effect is irresistible. The slow vibrations which proceed from the largest pipes of a great organ, and which are almost without the range of musical sounds, are able to shake the walls and floors of the building so as to be felt, if not heard.

We have here, also, the reason of the rule observed by regiments on the march, when they cross a bridge, viz., to stop the band, and break step. This is lest the measured cadence of a condensed mass of men should urge the bridge to vibrate beyond its cohesive force. A neglect of this rule has frequently led to accidents. The Broughton Bridge, Manchester, gave way beneath the measured tread of sixty men only, who were marching across it.

A few days ago a similar disaster befell a battalion of French infantry while crossing the suspension bridge of Angiers. Reiterated warnings were given to the troops to break into sections, but the rain falling heavily, the orders were disregarded; the bridge fell, and 280 men were killed.

When Galileo set a pendulum in strong vibration by blowing on it whenever it was moving away from his mouth, he gave a good illustration of the way in which small but regularly repeated disturbances grow into consequence. Professor Tyndall tells us that the Swiss muleteers tie up the bells of their mules, lest the tinkle should start an avalanche. The breaking of a drinking glass by the human voice, when its fundamental note is sounded, is a feat instanced by Chladin, who mentions it as an experiment frequently repeated by an innkeeper for the entertainment of his guests, much to his own profit.

Robert Stephenson has remarked that there is not so much danger to a bridge when it is crowded with men or cattle, or if cavalry are passing over it, as when men go over it in marching order.

A chain bridge crosses the river Dordonge on the road to Bourdeaux. One of the Stephensons passed over it in 1845, and was so much struck with its defects, although it had been but recently erected, that he reported them to the authorities. A few years afterwards it gave way when troops were marching over it.

The bark of a dog is able to call forth the response from certain strings of the piano; and a curious passage has been pointed out in the "Talmud," which discusses the indemnity to be paid when a vessel is broken by the voice of a domestic animal. If we enter the domain of music, there is no end to the illustrations which might be given of these sympathetic vibrations.

In the case of vibrations which are simply mechanical, without being audible, at any rate in a musical sense, the following ocular demonstration may be given: A train of wheels, set in motion by a strong spring wound up in a drum, causes a horizontal spindle to revolve with great velocity. Two pieces of apparatus like this are placed about ten or twelve feet apart. On the ends of the spindles, which face each other, are buttons about an inch in diameter. The two ends of a piece of white tape are fastened to the rims of these buttons. When the spindles, with the attached buttons, revolve, the two ends of the tape revolve, and in such directions as to prevent the tape from twisting, unless the velocities are very different. Even if the two trains of wheels move with unequal velocities, when independent of each other; their motions tend to uniformity when the two spindles are connected by the tape. Now, by moving slightly the apparatus at one end of the room, the tape may be tightened or loosened. If the tape is tightened, its rate of vibration is increased, and, at the same time, the velocity of the spindles is diminished on account of the greater resistance. If this tape is slackened, its rate of vibration is less, and the velocity of the spindles is greater. By this change we can readily bring the fundamental vibration of the tape into unison with the machinery, and then the tape responds by a vibration of great amplitude, visible to all beholders. If we begin gradually to loosen the tape, it soon ceases to respond, on account of the two-fold effect already described, until the time comes when the velocity of the machinery accords with the first harmonic of the tape, when the latter divides beautifully into two vibrating segments, with a node at the middle as the tension slowly diminishes, the different harmonics are successively developed, until at length the tape is broken up into a number of segments, only an inch or two in length, presenting the appearance of a beautiful wave line.—*Iron.*

Progress of Astronomy in the United States.

Mr. Richard A. Proctor, the distinguished British astronomer, bears the following testimony to the progress and results of astronomical science in this country:

"The American arrangements for extending government aid to astronomy seem to me to afford a model which might be copied with advantage on this side of the Atlantic. We see their physical observatories attached to other government establishments, to universities, and so on. Their professors of astronomy are not only real working astronomers, but skillful mathematicians (for the most part university men) and men of admirable zeal in the cause of science. I have been struck with the abundance, I had almost said the superabundance, of labor which has been bestowed on work, the record of which has recently reached me from America. Thus, in the mathematical investigations of the coming transits of Venus, a problem of difficulty has but to be suggested, to be at once attacked and solved to the utmost limits of exactness. The pictures of solar phenomena, spots, faculæ and prominences, are the most striking and beautiful I have yet seen. Their lunar pictures are remarkable for artistic beauty, as well as scientific value, and, altogether, their work, as I have said, is a model of our astronomers."

DOES THE SUN INFLUENCE A FIRE?—There is a common opinion, that the direct action of the rays of the sun diminishes the combustion of a common fire. This notion has often been ridiculed as erroneous; and, with a view to put it to the test of experiment, Dr. M'Keever ascertained the actual rate of combustion of well-known bodies, in different circumstances. It appears from these trials, that the quantity of wax-taper consumed in broad sunshine, in the open air, is less than consumed in a darkened room, in the same time, in the proportion of ten to eleven. When the experiment was made with a common mould candle, an inch in length was consumed in fifty-nine minutes, in strong sunshine, temperature eighty degrees; in fifty-six minutes, in a darkened room, temperature sixty-eight degrees. Other trials were made to ascertain the effects of the different colored rays of the prismatic spectrum on combustion, and it was found to proceed most slowly in the verge of the violet ray. The times of consuming the same length of taper in the different portions of the spectrum were, in the red ray, eight minutes; green ray, eight minutes twenty seconds; violet ray, eight minutes thirty-nine seconds; verge of violet ray, eight minutes fifty-seven seconds; the common opinion is therefore correct; but the difference is not so considerable as might be expected.

NON-CHEMICAL ANALYSIS.—That butter is not a single fat, but a mixture of fats, is perfectly well known to chemists, as may be seen on looking into almost any chemical hand-book. Apparently, however, there are those who profess to be chemists, who are not aware of the fact, as may be instanced by the following report of a certain chemist, who was called to testify in court as to the quality of a lot of butter, the value of which was in dispute:—"The butter contains a quantity of stearin and palmatin. It is therefore largely adulterated by the admixture of fat containing these substances, etc." The case in which this curious specimen of chemistry was exhibited was carried to a higher court, and is exciting some degree of interest. A public writer has already remarked that if the absence of stearin and palmatin had been established in the sample, demonstration would in reality have been given that the sample contained no butter at all; and under cross-examination the witness appears to have modified his report to a slight extent. He seemed to say that—though for aught he knew to the contrary, stearin and palmatin may exist in genuine butter—they do not exist in the free state in butter.—*Ex.*

Our Weekly Stock Review.

THURSDAY EVE., July 24, 1873.

The stock market has been "way dawn" and the general opinion seemed to be that the "bottom had dropped out" as prices did not reach it. The Virginia *Enterprise* says that some of the miners were a little afraid, under the state of the market, to go down into the lower levels of the Comstock, for fear the bottom would drop out altogether. At the latter part of the week, however, the prices rallied a little, though there was no great activity to speak of. The decline in value from July 1st to the 23d instant of thirteen leading mines, aggregated over $6,000,000. The prominent falling off in values as judged by stock prices were, Savage, $118.50 per share, or $1,283,000; Virginia Con. $36 per share, or $868,000; Ophelar, $21.50 per share, or $580,000; Yellow Jacket, $19 per share or $480,000; Crown Point, $8 per share, or $800,000; and Belcher, $10 per share, or $1,040,000. The declines in Crown Point and Belcher were in the face of dividends paid, although few shares changed hands. Savage is charged as being the cause of the whole list falling. It is rumored that there are no prospects of a settlement between the Raymond & Ely and Hermes Mining Companies, and that they are preparing for renewed litigation. The heavy fall in stocks has, of course, had the effect of reducing the amount of business done in the market. The fact that mining companies listed in the Board had paid up to June 30th the sum of $7,414,181 in dividends as against $4,026,000 during the same time last year, had no effect in keeping up even the prices of these stocks. Even the best-paying mines feel the effects of the decline of a fancy stock like the Savage.

On Friday the Stock Market was very weak, the break in Savage bringing everything else down. Saturday brought no more animation, and prices were low and weak.

On Monday the market was very dull, with prices still down to bed-rock figures, and no prospects of a rise.

Tuesday, stocks opened dull and weak, but recovered strength, and a comparatively better feeling was apparent in the afternoon, with, however, little variation in prices.

On Wednesday the Stock Market showed better indications, and prices were a little higher. Another bad break occurred to-day, quite unexpectedly to those who thought the market had touched bottom on Wednesday. A general decline was felt in stocks of every district: but Comstocks suffered most.

San Francisco Metal Market.

Leather Market Report.

[Reported for the PRESS by Dolliver & Bro.]

SAN FRANCISCO, July 23, 1873.

Prices of both French and American stocks remain about the same, with a trifling increase in the demand, and we look for a better trade during the coming month.

MINING SUMMARY.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

GOOD HOPE.—Amador *Dispatch*, July 19: Since the new hoisting works have been put in operation the surplus water has been taken out of the shaft, and the work of sinking and taking out rock has been commenced in good earnest.

KENNEDY MINE.—After a large amount of labor and expense, the old and new shafts have been connected by underground communication, thus giving the miners better facilities for getting out rock, as well as better means of escape in case of fire or other accident. The rock now being taken out is said to be unusually rich, besides being plenty.

CALAVERAS COUNTY.

A GOOD MINE.—Calaveras *Chronicle*, July 19: As we passed through San Andreas last Monday, our attention was attracted to the Lloyd Brothers' gravel mine, situated in that village. The claim is an old river bed or channel, varying from 100 to 260 ft. in width—the pay streak—from 2 to 4 ft. in depth and from 50 to 60 ft. below the surface. The mine is drained by a tunnel 800 ft. long. The gravel is raised out by hoisting works run by water power and dumped into an arastra worked by the same power, an ordinary sluice stream only being required to raise, crush and wash the gravel. The present working force is 12 men.

VERY RICH ROCK.—About the richest quartz we ever saw was brought to town the other day by some parties who recently discovered the lead from which it was taken. The lode is situated near Donnallan's bridge, about seven miles from Mokelumne Hill. The rock was so strung together with gold that it could scarcely be broken in pieces. We did not learn the size of the lead, but we understand that but very little work has yet been done upon it.

PRUSSIAN HILL mine let a contract to sink the shaft 100 ft. deeper; about 250 ft. in all.

NEVADA COUNTY.

EUREKA MINE.—G. V. *Union*, July 17: The following is from the official report of the Superintendent, Mr. Watt, to the Co. at San Francisco. The report is dated July 12, and says: "Our clean up for the last six days' run of ten stamps is 1,175 ounces of amalgam. We have commenced cross-cutting for the ledge in the bottom east drift. The west shaft shows good walls, but no ledge. The sixth level stopes look well, the ledge being large and good. No change in any other part of the mine."

SAN BERNARDINO CO.

ARLINGTON DISTRICT.—*Guardian*, July 12: The mines in this District are becoming to be almost as famous as those in the Clarke and Holcomb Valley Districts. They were first discovered by Mr. Bobelly, of Anaheim, and the locations have mostly been by citizens of that place. Quite a large quantity of very rich ore has been taken from the mines, which has sold in crude bullion in San Francisco for from $650 to $700 per ton. From the mines the shipment has been made via Anaheim to San Francisco. The leads that have principally been worked, so far, are the Big Blue, Lone Valley, Sonoma and Comet. These mines are situated about 60 miles northeast of San Bernardino, near the old Cusonbary City and 15 miles from Holcomb Valley. 50 or 80 men are employed in working them. Two companies are now making arrangements to put up smelting works. The successful development of mines in such rich districts as the Clarke, Holcomb Valley, Ord, Twenty-nine Palms and Liberal, makes it appear as though a new era of prosperity was beginning to dawn upon our town and county. The amount of supplies required for these mines—when they get fairly under way—will be no small item, and San Bernardino will be the depot from which they are drawn.

TRINITY COUNTY.

A MINING SPECULATION.—Trinity *Journal*, July 19: J. W. Smiley and J. G. Trotter have purchased a number of the gold mining claims at Smith's Flat near Douglas City. They intend to put in a large flume, take water in big pipe from Faulsen's ditch, and try what virtue there is in working old diggings in a scientific manner. Smith's Flat was noted for its uniform good pay, and was worked for a number of years successfully. At the front of the flat was worked away and the bank grew deeper, it became difficult, with the poor facilities for working then known, to strip enough bed rock in a season's work to pay well, and this past winter only one company has worked there. As the necessity for cutting more than one deep bed rock ditch will be avoided by the use of the improved mining appliances now in vogue, it is claimed that the ground that is yet left can be made to pay as well as that formerly worked.

TUOLUMNE COUNTY.

Tuolumne *Independent*, July 9: Confidence has shut down for reasons unknown, but supposed to be on account of law matters. The engineer is at his post to keep out the water.

The Golden Gate Tunnel is now in 268 ft., and the rock looks better than ever. The iron work for the new mill is being rapidly pushed at the Sonora Foundry, and the lumber is already on the mill site.

Fowles & Co. have commenced work on their quartz lode at Arastraville. They have just got the water out, —having been filled up last winter,—and have commenced sinking. This vein is a splendid one, and has yielded rock going $50 per ton.

Hidden Treasure, at Cherokee, has shut down for want of water. The Co. will now start in and push their tunnel. The contract has been let to run 80 ft. further, when it will strike the lode 150 ft. from the surface. When the contract is completed, the tunnel will be in 300 ft.

Nevada.

BELMONT.

EL DORADO.—Reese River *Reveille*, July 12: The large steam pump is in its place and working finely; the double track is finished from top to bottom; all the levels have good tracks in them and new turn-tables of a very light and strong pattern have been put in at each station. To stand at the lower station and see the cars coming, first from the north side, then from the south and next from the bottom of the incline, which is now being sunk in good ore, makes a fellow feel that this company means business. We spied around to see where this ore all came from, and were surprised to see such large, fine breasts of sulphurets in the north, and large strata of black metal in the south. We are well satisfied that this mine will be giving up its precious metals long after we poor mortals have gone to the happy hunting ground.

BELMONT CO.—Have quit sinking for the present, are drifting back for the ledge at the Canfield incline: are also sinking a winze into the ore body 500 ft. north of the Canfield shaft. The Highbridge works are completed and will toot the big whistle to-morrow. Our bullion shipments will greatly increase when the rich ores from the Highbridge are commenced on.

MONITOR CO. is still sending its rich ore to the mill; drifting lower tunnel back into the hill, also sinking the two winzes from the lower tunnel level down through good ore, and are very near water level.

THE MONITOR-BELMONT MILL.—This mill has been repaired and put in splendid order; it is running steadily on the ores of the Monitor and Belmont companies.

A great deal of work is going on in Jefferson Canon, Silver Point and the Spanish Belt. Johnny Grimes is hatting away on his Green and Oder mine near town, and if he has much of such ore as he showed us a few days ago, he must certainly have a big thing.

COPE DISTRICT.

EXCELSIOR.—Eureka *Sentinel*, July 13: This mine is located on the northwest side of Prospect mountain, and about two-thirds of the way to the summit. The improvements consist of an incline of about 70 ft., with a couple of drifts leading from it, and a tunnel about 50 ft. below the point of the drift. Work upon the latter is temporarily suspended. At the opening of the incline ore is to be seen lining its whole orifice, but of a low grade. Descending, both the quality and quantity of the ore increase until the first drift is reached. From this excavation a large amount of high grade ore has been taken, and still more is to be seen. Proceeding downward, can be seen extensive rich streaks of yellow carbonate of silver, and, when the end of the incline is reached, a force of men is found delving in an immense deposit of this silver-bearing substance. The body has not been sufficiently developed to allow of an opinion as to its proportions or extent, but the indications in general lead to the conclusion that fine mine will be opened.

ROBINSON DISTRICT.—We were shown last evening, by Mr. Lynch, who had just come in from Robinson, some very rich specimens of ore taken from the Sunburst mine in that district. The samples are composed of yellow carbonate of silver and galena. He informs us that several hundred tons of the same character of ore are in sight in this mine, and a large quantity already on the dump. We also learn from the same source that the 10-stamp mill which is in course of construction by the Watsou Company, will be completed and in operation within 30 days. Tha Hayes is the principal of the location owned by this company, and is yielding largely in free milling ore. It is the opinion of our informant that the district only lacks means for reducing the ores which the mines will yield to make it come into favorable notice. Robinson is distant from Hamilton about 40 miles, a stage line plying between tha two places.

EUREKA.

RICHMOND MINE.—Eureka *Sentinel*, July 12: Winze No. 5 displays the finest ore during its whole extent; in fact, nothing but ore is visible at all from its mouth to the extremity. The southeast drift displays the same amount of the metalliferous substance. It is between 40 and 50 ft. in extent, and is curvature in form. The body of ore has been exposed for about 200 ft. of its length, and will average 80 ft. in thickness. In some pieces stoping has been continued for 80 ft. without exhausting the mineral. In one place in the workings a shaft has been put down 58 ft., to test the continuance of the vein matter, and shows the most encouraging results. This was done during the presence of the recent suit between this company and the Consolidated, when it was a leading point for the former to show that they had a vein, and not a deposit. The Lizetto tunnel, which is being run from the north side of the hill, and which is intended to tap this body of ore horizontally, will be completed in the course of 4 or 6 weeks. Work from either end is being pushed on with all compatible speed. It will be over 500 ft. in extent.

THE K. K. MINE.—The main shaft of this mine has a depth of about 200 ft. The lower part is being cribbed, in order to allow the cage to pass down to the bottom, where drifts are to be opened. The only level from which any considerable work is being done is 135 ft. from the surface, and has been worked in about 400 ft. Three winzes have been sunk from this level, and each developes fine ore deposits. Was were shown through extensive workings, whose immense bodies of ore are exposed to view.

Truckee *Republican*, July 17: The Tecoma Silver M. Co. had their smelting works started up yesterday for the first time. The process used by the Tecoma Co. is believed to be the best known, and is the result of years of successful experience in the smelting of silver ores in Nevada and Utah. The ore now being smelted here is from the Co.'s mine at Tecoma. The Co. have two furnaces now ready for operation, and intend to erect a third one soon. They have on hand about 400 tons of silver ore from the Tecoma. Tha ore is very rich and assays from $300 to $400 a ton. They also have on hand about 20,000 bushels of charcoal. Of this they now use 200 bushels a day, but with the other two furnaces in operation they will consume about three times that amount. The works are kept in constant operation day and night, and from 35 to 40 men are employed. Up to last evening they had turned out 7 bars of bullion of 100 pounds each. The Co. possess abundant means and have large bodies of rich ore for smelting. The smelting works in this place will doubtless be kept in successful operation hereafter.

CITY CREEK MINES.—Salt Lake *Tribune*, July 12: From some gentlemen of reliability who returned from City Creek mines last evening, we learn that several of the locations look most encouraging and give promise of proving valuable mines. Amongst the ledges named were the New Jersey, General Scott, Henry, Flagstaff and Victoria, all looking well. The ore, our informants believe, will range from $30 to $60 per ton, and they are of opinion that City Creek will yet prove a good ore-producing district.

HARD SCRABBLE DISTRICT.

It is situated about 5¾ miles eastward from Mineral Hill, and was discovered last April, by Dr. Hanson and H. F. Anderson.

CLARENDON MINE.—This claim is in Slate formation, has regularly defined walls and shows a fine body of ore. A tunnel has been driven 60 ft., from the extreme point of which it is 40 ft. to the surface. From several assays the value of the ore is ascertained to be $100 per ton, and of a character to be amalgamated, although the ore of the district generally is plumbiferous and in a limestone formation.

THE WAVERLY MINE is of some promise, so far as explored, and yields ore which assays $30 per ton.

THE STARS AND STRIPES CLAIM is looking well, and being worked vigorously.

THE MARIPOSA LOCATION is owned principally in Eureka, and is working 3 men. The vein matter assays $30 per ton.

MINERAL HILL DISTRICT.

MINERAL HILL.—Eureka *Sentinel*, July 17: This mining camp is improving. The Mineral Hill Silver Mines Company are continuing vigorously the workings of their mines, and at present employ 60 men. Since the property came into the possession of this Company they have shipped bullion to the extent of $1,072,000 in value. The product for the last year has been $392,000. The Atwood mill is kept constantly in operation upon ore from the hill, and reduces from 15 to 20 tons per day.

The Taylor mill has been idle for some time, in consequence of a falling off in the ore products of the mines. This structure was erected and equipped at a cost of about $135,000, and is now offered for sale by the Co. It is nearly new, has 20 stampa, 9 amalgamating pans and settlers and a large engine from the Booth Iron Works, San Francisco.

THE SPENCER AND AUSTIN MINES, principally owned and managed by the Plummer Brothers, are giving employment to 6 or 8 men, and are producing some good ore. The development of these mines is retarded by the owners not having a mill by which to work their ore, the other company charging as high as $35 per ton for custom work.

PEAVINE DISTRICT.

It now seems probable that a mining revival has commenced in this once popular district. Mr. Toombs, of San Francisco has begun the erection of a mill, and will have it running inside of sixty days. It will be a water mill and will work the ore of the Poe lead. The ore of the lead will mill $17 per ton, and there being an abundance of it, it is considered that the speculation will prove a profitable one.

The new works of the Rossuth Company below Silver City will be supplied with water brought from the Silver Hill mine, through a flume three miles and a half long.

ITEMS.—THE CHAMPION MINES.—This mine was purchased by Messrs. Elzy, B. F. Bivens and others, some three years since. "The company, have four hundred tons of ore on the dump, worth from $75 to $250 per ton, besides an inferior quality, which is certainly worth $75 all through. An expert lately visited the mine and stated that, if in Salt Lake, it would readily sell for three millions." Mr. D. O. Turner, B. F. Bivens and many other Carsonites, are largely interested in the mine, and we are promised accounts of its progress, as well as of other mines in the same locality.

SECRET CANON.

THE GEDDES AND BERTRAND MINES.—Eureka *Sentinel*, July 18: They are all situated upon a line, the direction of which is north and south, and in the order following: Beginning at the south, the first of the series is the Calico, which is, perhaps, the first in importance, also, of the whole. Upon this a shaft has been sunk 150 ft., the first 10 ft. of which penetrate ore, and the remainder what seems to be, as it is technically termed, a "horse." The first drift is 53 ft. from the surface.

The next drift is 35 ft. from the surface and has a linear extent of 42 ft. After passing 8 ft. through the porphyry formation through which tha shaft penetrates, a fine character of ore is entered, and continues during the remaining 36 ft. of ths drift, save at its very extremity, where a sort of quartzite conglomerate comes in. A bisecting excavation is made 25 ft. from the mouth of the drift, and at right angles with ths latter. It has been carried through 18 ft., and brings to view nothing but ore. Another cross-cut has been made which extends 16 ft. from the drift, and carries ore 12 ft. of its length, the letter part penetrating a formation which is more lime than anything else. A third cut is run from this drift, close to its extremity, but developa nothing of interest.

The third level is 75 ft. from the mouth of the shaft, has been driven in a distance of 40 ft., and after passing through whet wo shall call the "horse," enters an ergentiferous formation similar in kind to that in the other workings of the Celico. At the furthermost exploration in this level the ore gives place to formations other than metellic. The first cross-cut is made at an angle a little greater than a right angle from the drift, is 12 ft. in length, and passes through nothing but high grade. Another drift has been put in from the level, in nearly an opposite direction from the ore already described, but has brought to light nothing worthy of note. The fourth level is 150 ft from the top, but, like the other, possesses nothing of interest.

WASHOE.

SAVAGE.—Gold Hill *News*, July 19: Sinking the incline has been again resumed, and is making good progress. The main south drift on the 1700-ft. level is being driven energetically ahead to make connection with tha north drift on tha same level from Hale & Norcross. A cross-cut west from the main south drift has been started near the south winze, but has developed nothing of material value as yet. Prospecting in other portions of the mine continues as usual, without change of interest.

COLLAR-POTOSI.—Daily yield, 140 tons of ore, worth, per assay value, $30 per ton. There has been little or no change in either the looks or yield of the different ore-producing sections of the mine during the week. The east cross-cut from the main northwest drift at the fourth section is still pushed energetically ahead, the face in quartz of a very promising nature.

IMPERIAL.—The cross-cuts at the 1700-ft. level afford nothing new to report for the week. Prospecting the other levels continues, with no change of interest.

OPHIR.—Sinking the incline is making steady progress, without change of interest to chronicle. The rock in the south drift at the 1300-ft. level is improving in character. Nothing new to report of the prospecting in other portions of the mine.

JULIA.—The main east drift at the 800-ft. level cut during the week some fine ore, with occasional spots of exceeding richness. The flow of water from the south cross-cut of the main west drift at the 1000-ft. level continued to gain upon the tanks until it reached a point 31 ft. above the station, where it was stopped, and from which the hoisting tanks are again gradually lowering it.

ARIZONA AND UTAH.—The shaft is now down 370 ft., the rock in the bottom working well, and good progress being made. Some rich feeders and stringers of ore were found last week, indicating an approach to the main back ledge. Sinking the winze in the main east drift at the 250-ft. level is making good progress, occasionally cutting bunches of good ore.

AMERICAN FLAT.—Sinking the incline is making good progress, the rock in the bottom working well. The southwest drift on the 400-ft. level of the Baltimore has cut through some fine indications of an ore body at that point, which is undoubtedly a continuation of that found in the Baltimore. Good developments may be looked for soon.

OCCIDENTAL.—Daily yield 35 tons of ore. This yield can be increased in a very short time to almost any desirable amount, the development already made showing the ore body to be both valuable and extensive. Tha mill is kept running steadily, crushing ore from the mine.

JUSTICE.—Work in the old Waller Defeat ground, which haa been suspended for the part week, will be again resumed in a couple of days. Ths ore in the main south drift on the 400-ft. level of the old shaft continues to improve, showing spots and streaks of exceeding thickness.

MINT.—A cross-cross in the main southeast drift at the second station, 30 ft. south of the shaft, is in 30 ft. passing during the week through a spur of the main ledge, 3 ft. thick, of fine ore. It is expected that the main ledge will be reached in a very few ft. more. Everything in and about the mine is working finely.

NEW YORK CONSOLIDATED.—Sinking tha shaft is progressing at the rate of 2½ ft. per day. Tha pump continues to handle the water with the most perfect ease, and everything in and about the mine seems to be conducted in the most economical business manner possible.

BALTIMORE CONSOLIDATED.—Driving the main west drift at the second station has made excellent headway during the week, encountering some fine indications of good ore developments in a very short time. Prospecting at the first station continues, with very encouraging indications of a continued enlargement of the ore body already found.

SIERRA NEVADA.—Daily yield 60 tons of ore, keeping the mill steadily running. The ore bresats in the upper and middle portions of the mine are gradually being extended further to the north and west, and show bnt little change in either tha quantity or quality of ora prodnced.

UTAH.—Sinking the shaft is making excellent headway, the work progressing downward at the rate of 2 ft. per day.

SILVER HILL.—Daily yield 60 tons, the assay value of which is $50 per ton. The main north drift at the second station is still driven ahead, the water no longer interfering with the progress of the work. The main north drift at the first station is being again pushed ahead, the ore in the face gradually improving in quality as the drift advances. The ore slopes on this level are both looking and yielding well.

CALEDONIA.—Daily yield 60 tons from the 400-ft. level. The main north drift at the 500-ft. level has developed good indications of a fine body of ore. Two cross-cuts have just been started from this drift. A winze has been started from the 400-ft. level to connect with the main north drift on the 500-ft. level. The winze is down 46 ft. and has developed some fine ore.

BUCKEYE.—Prospecting the various levels continues as usual, with no changes of importance to chronicle. The company's mill is kept steadily running on ore from the mine. An assessment of $1 per share, aggregating $16,000 was levied July 14, delinquent in the office of the company September 8th.

FRANKLIN.—Reopening the old tunnel is making excellent progress, the face in porphory. Small pieces

(Continued on Page 60.)

Spice Plants.

Ginger.

We present in Fig. 1 of our illustrations, an engraving in miniature of the ginger plant; root and top; and from the root of which is obtained a pungent but agreeable spice; well known and extensively used in all civilized countries. Ginger is cultivated in both the East and West Indies, as well as in South America, Africa and China; and could be cultivated in California with profit. The rhizome, or woody root-stalk which forms the ginger, is dug up when of sufficient size, cleaned, scraped and dried and in this state is called uncoated ginger; but when the outer skin is not removed from the root-stalks, it is called coated, and presents a dirty-brown appearance.

Independent of this difference in color, which is in the mode of preparation, it is supposed there are two varieties of the species, one producing white, and the other dark-colored ginger. Its well known hot, pungent taste is due to the presence of a volatile oil; it also contains a large quantity of starch and yellow coloring matter, inclosed in large cells. Ground ginger is largely adulterated with starch, wheat flour, ground rice, mustard, etc., in various proportions.

In a young state the roots are tender, fleshy and mildly aromatic; in this state they are preserved in sirup and form the delicious conserve known as preserved ginger. Ginger is an aromatic stimulant, principally used as a condiment, and much employed in the manufacture of various liquors, cordials and beers. An infusion under the name of ginger tea is much used as an aromatic tonic.

The Nutmeg.

The nutmeg tree, Fig. 2, is extensively cultivated in tropical regions for its valued products. It is comparatively a small tree, seldom reaching a height of more than 30 feet. The leaves are aromatic, and the fruit is very much like a peach, having a longitudinal groove on one side, and bursting into two pieces, when the inclosed seed, covered by a false aril, which constitutes the substance known as mace, is exposed. The seed itself has a thick outer shell which may be removed when dry, and which exposes the nucleus of the seed, which is the nutmeg of commerce.

The mace or covering, which is of a fine red or cinnamon color when fresh, becomes a golden yellow when dry. The nuts are liable to be injured by insects; to guard against which, they are repeatedly dipped in lime-water for several weeks after gathering. Even the fleshy pericarp is often used as a conserve. Nutmegs and mace are largely employed as condiments. They are both used in medicine as stimulants, carminatives and flavoring agents.

The best nutmegs are grown at Penang, or Prince of Wales Island, in the Straits of Malacca; they are about an inch in length, shaped like a damson plum, pale-brown in color and furrowed on the exterior, and gray on the inside, with veins of red running through them. From the foregoing it will be seen how widely the true nutmeg differs from that of the so-called wild nutmeg of California, as well in its general make up, as in the form of its foliage.

The Caper.

Here in Fig. 3, we have a creeping plant, a native of the South of Europe. The flower buds, and in some parts of Italy the unripe fruit, are pickled in vinegar, and form what are known as capers. There is an African species that furnishes berries with a pepper-like, pungent taste, and when dried are used as food. There are several other species, nearly all of which are possessed of vermifuge properties. The smell of this plant in some of its varieties is so detestable that no animal will eat the foliage.

The Cinnamon Tree.

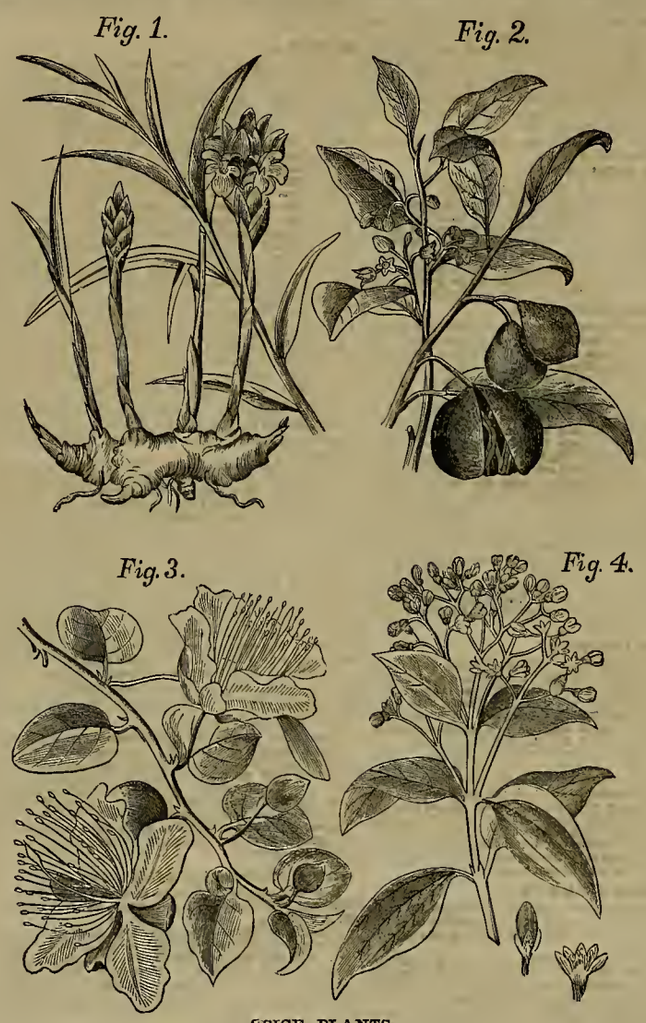
The true cinnamon is obtained from a tropical tree reaching a height of 30 feet and cultivated in many countries. Ceylon has long been noted for the excellence of its cinnamon, but commerce is largely supplied from the West Indies and South America. Its leaf and flower stalk are shown in Fig. 4. It is prepared by stripping the bark from the branches, which, on drying, naturally rolls up into quills, the smaller of which are introduced into the larger and then the drying completed in the sun.

Good cinnamon is generally known by the thinness of the bark; as a rule the thinner and more pliable, the finer the quality. When broken, the fracture should be splintery. It is largely used as a condiment for its pleasant flavor, and its astringent and cordial qualities give it a value as a medicine. From the root an excellent camphor is extracted, and the dried flowers are used as a spice. Cassia, has the flavor of the true cinnamon, but the bark is thicker, coarser and not so delicate in flavor, and is much used to adulterate the true article; the bark is more brittle and less fibrous in texture.

Riches vs. Poverty, or California as she is and Should be.

Written for the PRESS by ALMARIN B. PAUL.

Is it not reasonable to say that California has no superior in point of natural wealth and advantages of producing it? Wealth in the innumerable gold bearing lodes, which crop out in every range. Wealth in the water-power of her mountain streams. Wealth in a soil ever productive. Wealth in a climate which has no extremes of cold in winter or scorching heat in summer. Wealth in its clear sky and invigorating seasons; in its mineral springs and evergreen hills; in its ocean boundaries and railroad facilities; in all the natural advantages man can ask for. Yet, what do we see? Prosperity? No! not among the masses. Not in the mountains, where lie the golden treasures. Not in the towns, where once was life and bustle, where legitimate industry and the sweat of the brow made the heart beat light, and the welkin ring with cheerful song at the close of the day. Not in this commercial mart, where once were big brains to conceive and ready hands to execute, where energies were expended in building up a great commercial



SPICE PLANTS.

city—to be—where men prosecuted business for business sake; where the effort was to enlarge the fields of industry, by which the rich and the laborer were equally rewarded; where there was brotherly love and a desire to elevate one another.

How is it now? Poverty! unbounded poverty! Why is it? Why, as a people, have we lost sight of legitimate labor and become gamblers—capital gamblers, in fostering speculations for high rates of interest. The merchant gambles because trade is dull, and "stocks on the board" give life to weary hours, and besides he may win on the turn. The laborer gambles, he hears of riches to be gained in stocks. The servant girl ventures, "stocks may come up." All go in, and the coin only jingles in the go—poor deluded souls. And so it is all heads full of stocks, and at the expense of every legitimate pursuit. Legitimate endeavor is work, stock-gambling is play, and this "play" is ruining the entire Pacific Coast. Is it not? Where are your flourishing manufacturies which an abundant capital should foster and build up for the good of itself and the whole people. Where are your prosperous inland cities? What is the condition of the real estate market in the boasted "great" commercial city of the Pacific? Where is your commerce? Where are your efforts in opening up the wealth which lies in the quartz beds at your very door, in the mountains which every hour of the day are within your vision? Twenty-four years have passed, and where is it? Is it what should be expected of an industrious, intelligent, productive people? Is it what it should be, were we such? No, far from it. California produces less than twenty-five millions of gold, and has advantages which, properly cared for by legitimate effort, should produce one hundred millions per annum, and fill every mining camp with population, vigor and prosperity.

Some may say we are prosperous, and point to the fifty millions on deposit in our city banks. Fifty millions have been deposited, but where are they? What amount of that fifty million is cash on hand? Where is it? Gone, gone, gone,—gone to pay interest at from 10 to 18 per cent. per annum; gone to England, gone East, gone to China — gone from our sight and beyond our benefits. Can we thrive under such a condition of things? Thrive! It is impossible; but the evil will in time correct itself: but how much better it would be for us to correct the evil? It will correct itself by spreading greater poverty and creating more distress — by the poor becoming poorer and the rich richer; by suicides, insanity and ruin of every interest which makes a stable and prosperous State.

But where is the remedy, says one? It is in one universal effort to crush out this illegitimate, idling, non-producing, gambling spirit, so rampant among all classes. It is in business men confining themselves to their legitimate pursuits. It is in our men of wealth throwing off a little selfishness, and in trying to build up others, who are trying to build up themselves. It is in extending the advantages of capital to such pursuits as give labor to the masses, even at lower rates of interest, and feel a little that, as Carlyle says, "He is the true king of men who can *do* the most." It is in understanding the fact that interest above eight per cent. per annum, is ruin within itself. It is in considering ourselves as one of a Union of States, and not the financial centre of the world. It is in the Press of the coast, making a general onslaught against all this stock-jobbing, stock-gambling way of business generally. This universal, non-producing, idle spirit, which is too prevalent in the city and out of it. The whole country wants invigorating in a new channel—wants industry infused into it—wants encouragement—wants to be made *to go to work* and bring forth the vast riches spread before us, and gather back the trade that has traveled from us—open up a commerce—in fine we want to commence *business*. Californians ought to be the richest people on God's earth—rich in gold, rich in comforts, rich physically and mentally, rich in arts, rich in science, rich in institutions of learning and charities. We have all to make it, and heed not our advantages.

Popular Science.

Whatever book, magazine or newspaper we read; whatever lecture we listen to; with whomsoever we converse even, we are confronted with this inevitable phase. What is its exact meaning? Does it mean science for the people, or is it intended to convey the idea that it is science made generally interesting—or are both meanings to be included in the term? We strongly suspect that in many cases the name only serves as a cloak to cover what might be described as appreciation of the hackneyed experiments performed by the typical lecturer on scientific topics. This personage, in unveiling the hidden things of science, certainly lays claim to the title of entertaining expounder, and deserves it, in view of his strenuous efforts in securing it; though frequently his frantic endeavors to command attention fall so far short of the dignity of his theme, that the effect is truly laughable. Can it be that a love for science consists in, and is limited by, a curiosity to see whether those two colorless liquids really will produce a blue one, as the Professor has so confidently stated, and an anxiety as to when his next startling explosion will take place? It certainly is a fact that this affectation of "popular" science serves to attract many, to whom its hard, rigidly mathematical laws might have proved repulsive, and it is impossible that it should fail to impart many interesting, and oftimes useful, bits of information. And then in the "popular" science books, too, we are treated to the same sugar-coated prescriptions; and, to complete the simile, the doses are also homeopathically infinitesimal.

What is really needed, is the dissemination of scientific knowledge respecting the numberless issues of every-day life, the perpetually recurring question of relation between greatest effect and least labor, and the all-important matter of utilizing waste products—which, after all, is where we gain most in comparison with the inaccurate and wasteful processes employed by our fathers. Science brought down to the wants of common existence, the science which is applicable in what are termed small things, the science which is intelligible to the masses, is what should be properly, the definition of "popular" science. It is encouraging to note that this desideratum is being more and more felt, day by day, and the knowledge that heretofore has been locked, so to speak, in the arcana of the initiated only, and regarded as the sacred mysteries peculiar to a privileged class, is becoming ever more wide-spread as the means of acquisition are multiplied.

Still, we protest against the calm serenity with which complacent admirers (from afar) proclaim their devotion, and against so palpable a misuse of terms as that to which we have alluded.

A BUSY RAILROAD.—The Virginia and Truckee Railroad is only 51¼ miles long, and used principally for conveying ores from the Comstock mines, to the reduction works on Carson river. For the six months ending June 30th they carried 224,088,500 pounds of ore and 12,096,000 of tailings over the road. The *Enterprise* tabulates the tonnage statement as follows:

Articles.	*In Pounds.*	*Lumber in feet.*	*Wood in Cords.*	*Totals in Tons.*
Mdse	42,020,604			21,010
Lumber	70,915,872	23,638,624		35,457
Wood	108,420,000		43,368	54,210
Coal, stone	39,068,860			19,534
Ore	224,088,500			112,044
Tailings	12,096,000			6,048
Live Stock	220,000			110
C. Bullion	160,474			80
Totals	496,799,310	23,638,624	43,368	248,495

This is a very good showing for such a crooked, steep and short road. Hereafter, the number of tons of coal brought to the mines, will probably increase and the amount of wood proportionately decrease. The *Enterprise* says, that the weight of the crude bullion only is given; that is, the bullion in the rough, as it is taken from the retorts at the mills and sent to Virginia for melting, assay and molding into bars. Much of this crude bullion is brought to Virginia by the stages and by teams belonging to the mills where it is produced, therefore the table above given shows hardly half of the bullion produced. Did the table show the weight of the bars shipped, a better idea of the bullion product could be obtained.

COAL NEAR VALLEJO.—The Vallejo *Independent* of yesterday has the following: Matras Driscol, a resident of Vallejo, brought into this office, last evening, several specimens of coal he had just brought down from the Suscol Hills, some nine or ten miles north of Vallejo. Driscol represents that the coal in question came from the ranch of Thomas Morgen, where there are large deposits of the same. A piece of the mineral taken from near the surface of the ground contains considerable earth intermixed with it, but another piece coming from a depth of twenty-five feet in the bowels of the earth, is of a very pure quality of coal, heavy and of a shining dark-blue color, denoting its purity. Driscol also states that there are large deposits of various qualities on the ranch above mentioned, but that it is not being mined, and is waiting for capital to develop it.

Useful Information.

Resins.

By the action of the oxygen of the air most of the essential oils are gradually thickened, and at length converted into a substance termed resin. Resins are frequently met with in the vegetable kingdom; in some instances, as with coniferous trees, resin flows spontaneously from the wood in combination with an essential oil, so called Venice turpentine, which hardens by exposure to air. Some resins are extracted from vegetable matter by means of alcohol, this solution being either precipitated with water or evaporated to dryness. Resins are either soft, and are then termed balsams, chiefly solutions of resins in essential oils, or hard. To the former belong Venice turpentine, Canada balsam, balsam of Peru, Capaiva balsam, etc.; to the latter, amber (a fossil resin,) anime, copal, gum dammar, mastic, shellac, asphalte. The gum resins are obtained from incisions made in certain kinds of plants, the milky juice of which hardens by exposure to air; these substances are partly soluble in water, and yield with it in many instances, an emulsion; for instance, assafœtida, gum gutti, etc. Many gum resins possess a very strong odor and contain essential oils. Although it is customary to treat of caoutchouc and gutta-percha under the head of resins, these substances are not related to resins at all, but belong to a separate class of bodies, among which, according to Dr. G. J. Mulder's researches, the so-called drying oils must be enumerated.—*Cabinet Maker.*

Putting Old Saws in Order.

Laborers in the rural districts are not always aware how much unnecessary time and muscle are expended in the sawing of a few logs with a saw that is not in good order.

We have in mind two men who said they labored faithfully for two hours in sawing off one white-wood log less than four feet in diameter. Two men in Steuben county recently sawed off a hard curled maple tree, which had been down about one year, three feet one inch in diameter, in exactly ten minutes. They used the Champion saw, and had been sawing all day before coming to this cut.

It matters but little what kind of a saw is used, if the teeth are correctly filed and set. The very points of the teeth are the parts to be put in order. When the filing is finished the points of the teeth should all range as accurately as if they had been dressed off with a jointer. Then a saw will run through a log like a heated knife through a roll of butter. If four teeth are filed very fleam-like, and every fifth tooth be filed square across on both edges or sides and be about one-sixteenth of an inch shorter than the fleaming teeth, a saw will operate beautifully, provided the teeth are not set too much.—*N. Y. Herald.*

Rusting.—The slow combustion of metals is called rusting, and the oxide formed is called rust. All the familiar metals, except silver gold and platinum, are tarnished on exposure to the air; that is they become covered with a film of rust, or oxide. That heat is developed by rusting, as by other slow combustion, is shown by the fact that if a large pile of iron filings be moistened and exposed to the action of the air so that they rust rapidly, the temperature rises perceptibly. A remarkable case of heat developed by rusting occurred in England during the manufacture of a submarine electric cable. The copper wire of the cable was covered with gutta-percha, tar and hemp, and the whole inclosed in a casing of iron wire. The cable, as it was finished, was coiled in tanks filled with water; these tanks leaked, and the water was therefore drawn off, leaving about 163 nautical miles of the cable coiled in a mass 30 feet in diameter (with a space in the center six feet in diameter and eight feet high.) It rusted so rapidly that the temperature in the center of the coil rose in four days from 66 to 79 degrees, though the temperature of the air did not rise above 66 degrees during the period, and was as low as 59 degrees part of the time. The mass would have become even hotter had it not been cooled by pouring on water.—*Hand-Book of Chemistry.*

The Silk Worm.—The delicacy and fineness of the thread spun by the silk worm is one of the marvels of nature. The size of the threads is not uniform, but the smallest fibres wrought into the cocoon by the worm are so exceedingly minute that from 200 to 400 of them are sometimes required to make a single strand of the smallest sized sewing-silk. One ounce of the thread measures about 1¼ miles, and the silk fibres of which it consists would therefore reach about 400 miles. The fibres in four pounds of such thread, if stretched out as originally spun by the worm, would make a girdle round the earth.

Chinese Method of Mending Glass.—Take a piece of flint-glass, beat it to a fine powder, and grind it well with the white of an egg, and it joins the china without riveting, so that no art can break it in the same place. You are to observe, that the composition is to be ground extremely fine.

The Chinese grind shells to powder and use this powder in the way we do flock on paper-hangings.

Intensity of Frost in the Arctic Regions.—In the interesting account of the McClintock expedition to the Arctic regions, which appears in the first number of the *Cornhill Magazine* it is stated that the spirits in the thermometer occasionally descended as low as forty degrees below zero of Fahrenheit's scale, thus indicating (40+32) seventy-two degrees of frost! At a point above this, viz: seventy-one degrees of Fahrenheit, quicksilver is frozen; spirit, however, is never congealed by the intensest cold. It appears from the voyage of the Fox, that eighty degrees of frost, or forty-eight of Fahrenheit, was registered by Captain McClintock and his crew at the beginning of 1859.

Drowning in Lake Tahoe.—We believe that it is a well established fact that the bodies of persons drowned in Lake Tahoe have never been recovered, the clear, cold waters of the lake absolutely refusing to give up their dead. This circumstance, which at first thought appears strange, is accounted for upon the hypothesis that the waters at the bottom of the lake are so icy cold as actually to arrest decomposition and consequent expansion of the dead body, one of the conditions under which it would be expected to return to the surface.—*Gold Hill News.*

Acid in white lead may be detected by putting a small portion of the lead in a cup, pouring a little warm water over it, and stirring the lead in the water. Then add a few drops of a solution of iodide of potassium; and if the lead is acid, or contains acetate of lead, the water will turn yellow.

Flame is one of the most beautiful things in the world. Not a sunset sky in summer, not a full-blown tropic flower, is more brilliant than flame; flame is the *flower* of fire. The ivy has no splendor like the mantling flame; it reddens like the thyrsus of the god.

The abestos of New York and Vermont yields fibres up to 40 inches in length. Handkerchiefs of this material might be "washed" in the fire instead of by the launderess.

Good Health.

Drinking at Meals.

As to when and how much a person may drink, it depends somewhat upon the constitution of the person, the nature of the food, and the character of his occupation. A thin, dark-complectioned, cool organization generally does does not incline to drink much, especially if the exercise taken is not violent or laborious, or not calculated to promote perspiration. In a plump, rosy, warm nature, with light hair, blue eyes, large lungs, and of active or laborious habits, inviting perspiration, more liquid is required and generally taken.

Then again, the kind of food eaten is to be considered. If one eats fish, or dried salted provisions, dry bread and little or no fruit, and a large amount of sugar, fatty matter, and other heat-producing articles, the desire and necessity for a considerable amount of fluid is indicated. If a person have a medium constitution, and is not exposed to heat and violent exercise, and his food be normal and hygienic, he will be surprised how little drink he will require. A person who eats freely of vegetables and fruit, and moderately of beef and mutton, not cooked dry, will not need much moisture as drink.

No person should "wash down" food with any kind of beverage. Those who drink tea and coffee should let it stand until cool, and this should not be taken with the food, but at the beginning or nearly the close of the meal—mind you, *we* do not *advise* their use. Nature has provided the mouth and throat with salivary glands, which produce moisture and will sufficiently moisten dry bread or crackers, or parched corn, if one do not eat too fast. Many a dyspeptic has cured himself by avoiding drink during meals and eating dry food slowly, masticating it thoroughly, and moistening in the mouth. If people would learn to eat bread without butter, using nice, fresh stewed food instead, they would avoid biliousness, dyspepsia, headache, pimples, a greasy and leathery skin, and *also* the supposed necessity for drinking much either at or after meals.

Animals never drink while eating (unless kept in a pen and fed on semi-aqueous food.) The worked horse or ox, with water at his manger, will, if thirsty and hungry, drink when he comes to the stable, but he will then eat dry hay or oats for an hour or two and not approach the water meanwhile. Grass in the field being moist, cattle at pasture drink but little—sheep and goats very rarely. Sheep feed early, when the grass is covered with dew, but for weeks together will not descend from the lofty hill-top to drink from the springs which flow from its base.

The food of man, as it is ordinarily cooked, is likely to contain about as much moisture as does the grass in hill pastures. Men are made thirsty by the condiments they eat, and by the heat-producing articles which constitute the bulk of their food. Beef steak and roast beef, eggs, poultry, fresh fish, and ordinary table vegetables contain from 75 to 90 per cent. of water. The drinking of water and other beverages is largely the result of habit, and no little disturbance of the health is the consequence. If one takes no drink but water, he is not very likely to drink too much in the course of twenty-four hours if he eats the right kinds of food and has no bad habits. We would, even with right habits of eating, discourage much drinking during a meal or immediately after it.

Years ago, when many drank cider as a common drink, an old farmer in our neighborhood often ate bread and cider as we do bread and milk, and he always insisted on having a mug of cider alongside of the dish, saying he wanted cider to drink when he ate bread and cider as much as when he ate other things. We have seen hungry boys, when eating bread and milk, take up their bowl and drink between times, as if a meal of bread and milk, like bread and cider, were too dry for health and comfort without intermediate drinking. We think people should drink less than they do even of that only proper drink—pure water.—*Phrenological Journal.*

Cure of Dyspepsia.

Dr. Dio Lewis gives the following advice to a dyspeptic, with the promise of a cure if it is faithfully followed for three months.

1. Rise early, dress warmly, and go out. If strong, walk; if weak, saunter. Drink cold water three times. After half an hour come in for breakfast.

2. For breakfast eat a piece of good steak, half as large as your hand, a slice of coarse bread, and a baked apple. Eat slowly. Talk pleasantly with your neighbors. Read the cheerful comments of loyal journals. Avoid Copperheads as you do hot biscuits and strong coffee. Drink nothing.

3. Digest for an hour, and then to your work. I trust it is in the open air. Work hard till noon, and then rest body and mind till dinner. Sleep a little. Drink water.

4. For dinner (two or three o'clock) eat a slice of beef, mutton or fish as large as your hand, a potato, two or three spoonfuls of other vegetables, and a slice of coarse bread. Give more than half an hour to this meal, Use no drink.

5. After dinner play anaconda for an hour. Now for social, pleasant games. Have a good time.

6. No supper. A little toast and tea even, for supper, will make your recovery very slow.

7. In a warm room bathe your skin in cold water, hastily, and go to bed in a well ventilated room before nine o'clock.

A Variable Diet Necessary.—Man being omnivorous, his food must be varied frequently for the full development of those mental and physical powers which give him dominion over the earth.

If only one kind of food is supplied for a considerable time, as that of potatoes for example, there will be strong muscles but a feeble brain force. A varying diet, one thing one day and something the next, not on the table at every meal, has a wonderful influence on the harmonious manifestations of both mind and body. Varying the diet furnishes elements essential to health. It conduces to the moral well-being of an individual who is both peevish, dissatisfied and a grumbler if the same dishes appear invariably at breakfast and dinner. Coffee and tea, properly prepared, are not loathed, but are always welcome; but nothing else is, on a boarding house table. In keeping house we provide what we like. That is the difference.

A positive reason why such multitudes fail of success in keeping boarding houses is because they serve precisely the same articles all the time. A devoutly christian stomach rebels against that system. On the other hand, hotels or boarding houses having the reputation of an admirable table have more patrons than they can accommodate. That is the whole secret of having no vacant rooms. Starving is no economy, as the cost of advertising for lodgers is vastly more expensive than a generous variety every day in the week, which would keep the house full.

Living well simply means not to subsist on the same kind of food, cooked always in the same manner. The laws of physiology demand a varying diet, and those hoping for good paying boarders should profit by the suggestions of science.

Fat and Lean.—Meat eaters and vegetarians show in their persons the effects of the diet. The first has the most brain force and nervous energy. A mixed food of animal and vegetable rations developes the highest intellectual powers. A strictly vegetable living ordinarily gives a fair complexion and amiability and extreme pugnacity when the vegetarian's views in regard to that one engrossing thought of his life are discussed. They are annual-meeting reformers, without ever setting a river on fire.

Arabs are a sober, frugal race, rather slender, not tall, conscientious and contentious on religious subjects. They largely subsist on rice, pulse, milk and kemac, something similar to a whipped cream, through a vast region of an arid country where they are indigenous. They are not destitute of mutton, goats, camels and game; but they manifest no disposition to feed upon meats, as is necessary in temperate zones or in high northern latitudes.

An intellectual man, one of their kindred, who rises to distinction by the grandeur of his mental status, is extremely rare.

The beer and ale drinkers expand and grow fat, but they are not much given to profound researches in science.

Domestic Economy.

Good Cookery.—In summer, particularly, health depends considerably upon untroubled digestion, and to secure this happy state of affairs good cookery is essential. In order to acquire health, beauty, strength, and spirits, we need nourishing food; and we will further say that we do not acquire those faculties or conditions of the mind and body, because our digestive apparatus gets out of order by reason of the indigestible nature of the food crowded into it. The greater part of the truly nutritive and digestible food is spoiled in the cooking, and so rendered unhealthy. It is the business of the cook to know what is to be cooked and how to cook it; and to do this well, vigilance and precision are indispensable requisites Again, in order to encourage the machinery of mastication, food must not only be well cooked, but put on the table in the neatest and most elegant manner. The good opinion of the eye is the first step toward awakening the appetite. Decoration is much more rationally employed in rendering a wholesome, nutritious dish inviting, than are the elaborate embellishments which are crowded about trifles such as custards, cakes, etc. Food to be eaten in perfection must be put into the mouth immediately after being cooked—anything overdone cannot be mended, but if a little underdone, the stew-pan, gridiron, or oven even will rectify the mistake. If overdone the best juices of meat are evaporated, and will serve merely to distend the stomach, and if the sensation of hunger be removed, it will be at the price of an indigestion. We repeat that the art of good cookery lies in perfect neatness, precision, and can be acquired by any one.

Dry Method of Cleaning Soiled Fabrics. Great progress has been made of late years in the method of cleaning soiled articles of dress, by removing tar, grease, etc., from wool and other raw material, this as it appears, being accomplished best by the so-called dry method rather than by the use of a watery solution of soap or other alkaline substance. This originally consisted in subjecting the articles in a proper apparatus, to immersion in benzine, gasoline, bisulphate of carbon, etc., with continued rotation of the apparatus. More recently, however, it has been ascertained that the vapor of these substances, caused by distillation, is more efficient than the liquid substances themselves, the articles thus treated being much more thoroughly penetrated, and more rapidly than in the old way.

The articles are placed upon a grating over the liquid, the vapor from which permeates them completely as it is carried over into the reservoir, where it is condensed and is collected. In this form it contains grease in solution, which may be removed by a second distillation, while the hydro-carbon is obtained in a form for further use.—*Harper.*

Mutton Hams.—This method of curing mutton like hams deserves notice. The meat should be fat. Mix two ounces of raw sugar with one ounce of common salt, and half a spoonful of saltpetre; rub the meat with this mixture and place it in a deep tureen; let it be heaten and turned twice daily for three consecutive days. The scum having been removed, it is to be wiped and again rubbed with the mixture. Next day it should be again beaten, and the two operations ought to be repeated alternately during ten days, the meat to be turned each time. Let it then be exposed to the smoke for ten days. The meat should be eaten cold. To cure German hams, as in Westphalia, let them be placed in tubs and covered with layers of salt and saltpetre; a few laurel leaves should be added. At the end of five days they are covered with brine. At the end of three weeks afterwards let them be taken out and left to soak for twelve hours in clear well water. Let them be exposed for another three weeks to smoke produced by juniper branches, in November and March.

Preserving Fruits.—It is generally known, that boiling fruit a long time, and *skimming* it well, *without* the sugar, and *without* a cover to the preserving pan, is a very economical and excellent way—economical, because the bulk of the scum rises from the fruit, and not from the sugar, if the latter is good; and boiling it without a cover, allows the evaporation of all the watery particles therefrom; the preserves keep firm, and well-flavored. The proportions are, three-quarters of a pound of sugar to a pound of fruit. Jam made in this way, of currants, strawberries or raspberries, is excellent.

To Pickle Whole Tomatoes.—Prick each tomato with a fork to allow some of the juice to exude, put them into a deep pan, then add vinegar, pepper, cinnamon and cloves, sprinkle some salt between each layer, and let them remain for three days covered, then wash off the salt and cover them with a pickle of cold water which has been boiled with the spices. It will be ready for use in ten or twelve days, and is an excellent sauce for roast meat of any kind.

Pig's Head Baked.—Let it be divided and thoroughly cleaned; take out the brains, trim the snout and ears; bake it an hour and a half; wash the brains thoroughly, blanch them, beat them up with an egg, pepper and salt, and some finely chopped or pounded sage, and a small piece of butter; fry them or brown them before the fire; serve with the head.

MINING AND SCIENTIFIC PRESS.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—An Improved Truss Bridge; Academy of Sciences, 49. Riches vs. Poverty; Popular Science; Spice Plants, 54. Hydraulic Mining; The Blowpipe and Its Use, 56. Grout's Balanced Slide Valve; The Emperor at Vienna Exposition, 57.

ILLUSTRATIONS.—An Improved Truss Bridge, 49. Spice Plants, 54. Sectional View of Grout's Balanced Slide Valve, 57.

CORRESPONDENCE.—Notes of Travel in Eureka County, Nevada; Milling at Mineral Hill, 50.

MECHANICAL PROGRESS. — Ancient Construction; Safety Lamps in Mines; A Novel Railroad Stove; Station Announcer; To Distinguish Iron from Steel, 51.

SCIENTIFIC PROGRESS.—Sympathetic Vibrations in Machinery; Progress of Astronomy in the United States; Does the Sun Influence a Fire; Non-Chemical Analysis, 51.

USEFUL INFORMATION. — Resins; Putting Old Saws in Order; Rusting; The Silk Worm; Chinese Method of Mending Glass; Intensity of Frost in the Arctic Regions; Drowning in Lake Tahoe; Acid, 55.

GOOD HEALTH.—Drinking at Meals; Cure of Dyspepsia; A Variable Diet Necessary; Fat and Lean, 55.

DOMESTIC ECONOMY. — Good Cookery; Dry Method of Cleaning Soiled Fabrics; Mutton Hams; Preserving Fruits; To Pickle Whole Tomatoes; Pig's Head Baked, 55.

MINING STOCK MARKET.—Table of Daily Sales and Prices and Comparative Prices for the Week; Notices of Assessments; Meetings and Dividends; Review of Stock Market for the Week, 52.

MINING SUMMARY from various counties in California, Nevada and Utah, 53-60.

MISCELLANEOUS.—Mount Diablo Coal Mines, 50. A Busy Railroad; Coal Near Vallejo, 54. Inventors among Kings (Poetry); Eureka Consolidated Company's Mines; Gold in Indiana; The Geology of Nevada; Opening of a New Mining Region; Cortez District; Carson River and Its Waters, 58. Patents and Inventions, 60.

THE TAYLOR MILL, at Mineral Hill, which cost $135,000, is offered for sale by the company. It has 20 stamps, nine pans and settlers, a fine, large engine and a Stetefeldt furnace. The furnace is of no value, as experiments proved that as high a percentage of assay value could be obtained by working raw pulp in pans as by using a chloridizing furnace.

THE ST. JOHN'S Quicksilver mine has shipped another lot of 50 flasks to this city. The present production of this mine is nearly equal to one-third of all the mines in Lake and Napa counties. It turns out 50 flasks per week. The Oakville mine produces about 15 per week.

THE BALDWIN Exploring Expedition has left Salt Lake City. The expedition is fitted out to search for minerals and to locate mines. There are eight men in the party. They do not expect to get back to Salt Lake before next December.

THE "*Cottonwood Observer*" is the name of a new paper published at Alta City, Little Cottonwood, Utah. We wish it better success than its predecessor, the "*Independent*," and hope it will give us all the mining news of its locality.

OREGON MINERS are doing pretty well this year as they have more water than usual at this season on Clark's creek, Shasta, and other places. Rye Valley is spoken of as likely to be one of the best mining districts in Oregon.

A SALT LAKE paper says that Smith & Earle, of that place, are about commencing suit against Wm. M. Lent *et al*, to recover $10,000, alleged to be due them out of the celebrated Arizona diamond enterprise.

THE Eureka Consolidated Mining Company are putting up a machine shop, to repair their machinery when it becomes necessary.

THE Portland ice factory makes ice and sells it at 2½ cents per pound.

Hydraulic Mining—Working Abandoned Claims.

In traveling through the mining counties of California, one sees partially depopulated towns, abandoned diggings, and old and dilapidated cabins. The conclusion naturally drawn is, that the mines are worked out, and that there is no longer any inducement for men to remain. This may, to a certain extent, be true, but as a general proposition is incorrect. It will be remembered that in the early years of California mining, the rush was to the rivers, cañons, gulches and ravines, where the gold had concentrated, so to speak. Then diggings were located of a different nature, and in some localities quite early, deep diggings were worked by drifting and bringing the ground to the surface and washing, with good results.

The early mining was principally done by main strength and awkwardness, a system which lasted several years, and gave employment to large numbers of men, who had to be supplied with all the necessaries of life and as many of the luxuries as possible; hence the large towns were built. In a few years the State was "cleaned up," so to speak, in places where gold had concentrated by the action of the elements for ages, and the miners found themselves working back into deeper and less productive ground, following the pitch of the bed rock and cutting down the "rim rock" to get fall and washing off what is known as "brow ground." In doing this a different system of mining, more economical, careful and systematic, had to be pursued. The reckless waste of the first few years was checked in part and improved appliances and methods adopted to save the gold.

From this has grown up the great system of hydraulic mining for which California is famous, with all its improvements and appliances for handling enormous streams of water with ease, and breaking up and washing off vast extents of ground with comparatively little labor. The demand has been, and is, for water, not men. This fact, together with the mining excitements in neighboring States and Territories, drew miners from our gravel mines. For this reason many towns and mines were abandoned. While it is true that the kind of mines worked in early times are few and far between, it is also true that the great, deep gravel deposits of California are comparatively untouched or but slightly worked, and may be considered as practically inexhaustible. This class of mining will for a long time be the leading source of our gold product. It requires, however organized capital and labor to develop these mines, but fortunately capitalists are beginning to turn their attention in this direction. They are, however, doing it cautiously as yet, for most of them have been making money from stocks, rather than legitimate ventures, and they have not become accustomed to *bona fide* mining. The gold that has been produced from these mines forms but a small fraction of what remains locked up in these vast mountain deposits, waiting the energy and enterprise of man to set it free and send it into the commerce of the world.

In support of the proposition that our abandoned and neglected mines are not really exhausted, we may cite a few cases from Sierra county alone. Gardner's Point, two miles below the town of St. Louis, was many years ago quite a mining district, but was abandoned for hydraulic mining 12 or 15 years since. This property, embracing over 50 acres of ground and a small ditch with a capacity of about 400 inches of water, was sold to Colonel Baker two years ago for *three thousand dollars*. This gentleman fitted the property up in good shape with all modern improvements, and in the spring of 1872 took about $28,000 out of less than two claims of one hundred feet square each; or say about 20,000 square feet of bedrock worked over, the average depth of gravel being about 30 feet, capped with volcanic ashes ten feet in depth. Then last spring with a very limited supply of water he has taken out a little over $20,000 out of less than 1¾ claims, or about 17,000 square feet of bed-rock worked over; thus making the average for two years, about $1.30 per square foot of bed-rock, or $1.30 to 30 cubic feet of gravel washed; or $1.16 per cubic yard, and upwards of $50,000 to the acre. Very fair this, for ground sold for $3,000 and a ditch thrown in. Next to Baker's ground on the south and east, are some 200 acres of ground, 100 acres of which may be classed as good ground for hydraulic mining, and can be opened by a short tunnel.

Next in importance as a hydraulic mine, in the district referred to, is the Empire company's ground. It embraces about 280 acres; about 100 acres of this location is good hydraulic ground and can be opened by tunnel. The owners of this property have driven in a drain tunnel in search of drift diggings. This tunnel proved to be at too high a level, as it left bed-rock soon after striking gravel for 1,800 feet; but the owners having washed the gravel taken out of the tunnel have proved conclusively that it does not vary materially in richness from that worked by Col. Baker. Here then are over 250 acres of ground containing more than ten millions of dollars.

A little further up the ridge and near Howland Flat, Mr. George Coe bought up the ground on Granite Hill, last fall, and has completed an old tunnel (already begun), through which he has worked with good results. He has taken out some $25,000, and is probably now cleaning-up generally. This ground was also abandoned for hydraulic diggings for many years. The ground pays about 30 cents per square foot of bed-rock, and about the same per cubic yard, as the bank is only about 25 feet in depth. It will be deeper as he works back; he has several years' work ahead.

What we have said of these localities may be said of many other mining districts in the State. One serious drawback to the mines in the upper ranges of mountains is the limited supply of water. Yet the miners spoken of in Sierra county, are not as bad off as those in some other places, as many of them have been piping until quite recently and are now cleaning up.

The Blowpipe and its Use.

The use of the blowpipe has grown from a small beginning to an important place in mineralogical and chemical research. Originally confined to a few mechanical processes of limited sphere, it now has become an invaluable assistant in the laboratory. To Swedes, Von Cronstedt, Bergmann and Gahn, is due its first employment in science; and in the hands of Germans and an American, Berzelius, Harkort, Plattner and Richter, it became one of the most important aids in certain branches of science which we possess.

Although the blowpipe has been proved invaluable in chemistry, metallurgy and mineralogy, many still look upon it rather as a toy and apply it only in the simplest reactions; and others who acknowledge its usefulness in qualitative work, deny its value for quantitative analysis. Yet we possess hardly anything which enables us to obtain so correct results with so little material and so little expense of time and money.

But the blowpipe is an instrument which demands thorough preparatory instruction in its use. It is undoubtedly the want of this which has caused the underestimation of its value. A person cannot use it to advantage unless he has studied carefully the preliminary steps under competent instruction. He must have learned to produce properly the different flames—the oxidizing and the reducing—and to distinguish between the different reactions. How often we have been shown "bismuth" ore, because the miner could not distinguish between the bismuth and the lead sublimates; and sublimates of different metals which were merely the ash of the charcoal support.

The book which has been used generally in this part of the country as a manual for the blowpipe, is Elderhorst's reproduction of Von Kobell's publication. This book is very good for reference by persons who have had proper experience, but as a guide for beginners is unreliable. It is, however, of convenient size and contains convenient tables, two qualities which, in the absence of other satisfactory works, have made it popular. The best work on the subject, and the only one which gives complete satisfaction, is Prof. Plattner's Blowpipe Analysis, edited by Prof. Richter. Plattner was, and Richter now is, the best authority on the subject in the world. The work is now attainable by all of our readers through an excellent translation* published by Prof. Cornwall, of Princeton College, N. J., and to this translation we wish to call attention.

Extent of the Use of the Blowpipe.

The blowpipe is of especial use to the miner and the metallurgist, and with it he can determine the presence and amount of any metal of value to him. To the chemist it is also most valuable. Let us consider how far it may be used.

Of the sixty generally recognized elements (we do not consider here oxygen, hydrogen or nitrogen) all but thirteen can be readily detected by the blowpipe, and these thirteen, with one exception, are all of but little importance to the miner and of very rare occurrence. They are calcium, erbium, glucinum, iridium, lanthanum, palladium, platinum, rhodium, rubidium, ruthenium, thorium, yttrium and zirconium. Even in regard to these the mineralogist will find rules for their detection, with the exception of one or two, whose properties (on account of their rarity) have not yet been satisfactorily investigated.

The blowpipe is also of use, but only to a very limited extent, in qualitative *organic* analysis.

Quantitative assays can be made of gold, silver, copper, lead, bismuth, tin, cobalt and nickel, iron, chromium and mercury. (The last is added to Richter's work by Mr. Cornwall.) Moreover, the hygroscopic moisture, coke production, amount of ash and absolute heating power of coals can be readily determined. These quantitive assays are not merely approximate; many of them are as accurate as, and even more accurate than, the methods commonly employed. To these we must add the employment of quantitative assays with the blowpipe for determining various substances in quantitative chemical analysis, a method which can be applied with accuracy for phosphorus, chlorine, the earths, copper, iron, manganese, arsenic, chromium and perhaps other metals.

Preparatory Instruction.

While it is true that the blowpipe is a simple instrument, easily manipulated, and readily giving excellent results, it must not be imagined that anybody can become a good analyst without proper preparation. The trowel and the saw are simple tools, yet no one would think of claiming that a person could become a skilled mason or carpenter without due apprenticeship. On account of its very simplicity the greatest need exists for proper introductory study. This need is supplied by Plattner's manual as by no other work, and the difficulties which beset the beginner are thoroughly explained. It may be useful here to note the general course of instruction pursued by Prof. Richter.

The professor carries the student through the various tests with simple substances, which best illustrate the various reactions, and no complex materials are handled until the student has learned to distinguish these reactions and to produce them successfully. His proceeds in the following order: 1. Testing on charcoal for odors, coats, flames, etc. 2. Testing in the matrass for phosphorescence, decrepitation, change of color, evolution of gases, etc. 3. Testing in closed tubes for sublimates. 4. Testing in open tubes for sublimates, sulphurous acid or other gases. 5. Testing in the platinum forceps as to fusibility, color of flame, etc. 6. Practice in roasting (with copper pyrites). 7. Examination with borax bead and, 8, with salt of phosphorus bead. 9. Test for sulphur and for manganese. 10. Test with cobalt solution. After an hour's practical instruction, at least, has been given in each of these tests, and the student has had opportunity to repeat all the reactions by himself, then the Professor gives substances to illustrate the regular course of examination, and finally the student is introduced to quantitative assaying. Before each hour's practice the Professor has lectured on the subjects which are to follow.

The English translation of Plattner's manual has been carefully prepared by competent hands and is to be recommended to those wishing to know something about the blowpipe. The translator has remained closely by the original and has thereby done well, for the original is remarkably well and clearly written. We notice a few minor mistakes and several omissions in the index, which we hope will be attended to, should the translation reach a third edition—an evident possibility, as the *second* edition has already appeared. Prof. Cornwall has added to the original some valuable matter, notably the quicksilver assay and Prof. Egleston's scheme of analysis for common substances. As the latter will be useful for many of our readers, we reproduce it with some omissions and modifications.

We give the schemes with some alterations partly for the sake of simplification and partly because it could not be transferred in its exact form to our paper. As it stands in the book it guards more accurately against possible errors—as in the coatings; but by merely giving references to other parts of the book, the student is given considerable trouble to find exactly what he wants. Our modified scheme will be found sufficient for the requirements of most of our readers whom we refer with pleasure to the book in question for more information.

* Plattner's Manual of Qualitative and Quantitative Analysis with the Blowpipe. From the last German edition, revised and enlarged by Prof. Th. Richter. Translated by H. B. Cornwall, A. M., E. M., assisted by John H. Caswell, A. M. New York: D. Van Nostrand.

THE material for the military telegraph to be built in Arizona, between Maricopa Wells and Prescott, has been shipped to Fort Mohave, and operations will soon be commenced on the line from Fort Yuma to Tucson by way of Maricopa Wells. The section from San Diego to Fort Yuma, the *Union* thinks, will not be commenced until an additional appropriation is made by Congress.

THE Leviathan Mining Company has commenced suit against the Segregated Belcher Mining Company, to obtain possession of 2,000 linear feet of ground on the lode. The former company claims a possessory right to the ground which the Segregated Belcher did not have when it applied for a patent to part of the ground in dispute.

Grout's Balanced Slide Valve.

Balanced slide valves are very important improvements over the old fashioned slide valves for steam engines, and several varieties of them are in use, all working on the same principls, the only differences being in modifications of detail of construction. One now being introduced on this coast is Grout's Balanced Slide Valve, which is highly spoken of, and which we herewith illustrate.

Fig. 1 is a sectional view, centrally of the valve and the steam-chest, in the direction of the valve motion; Fig. 2, a section centrally of the same, transversely of the motion; Fig. 3, the upper face view of the valve and wire-bar; and Fig. 4, the under face of the steam-chest cover; *A A* being the sides of the steam-chest, *B* the cover, *C* the valve, and *a a* the port face on the cylinder. The valve fills the space between the inner face *b b* of the cover, and the port face *a a* on the cylinder, Figs. 1, 2, and is so adjusted to these faces that it moves both steam-tight and freely between them.

Its steam-tight yet free movements are dependent upon the following artifices:

1st. The inner face of the cover is made inclined toward the port face on the cylinder, transversely to the valve motion, and the upper face of the valve is inclined in like manner, Fig. 2.

2d. Such inclination gives unequal areas to the sides of the valves which it connects, that side toward which the inclination tends being the smallest. More force of steam must therefore constantly act upon the other or larger side, and press the valve in the direction of the side. And

3d. Such pressure is there met and carried by the steel bar *l*, laid at the heel of the smallest side, parallel to direction of the valve motion, which bar is firmly held and moved by the adjusting screws *m*, these being tapped through the side of the steam-chest, and operated from the outside.

From these arrangements it is apparent that, while the steam keeps the valve thus steadily up against the bar, the bar, adjusted by the screws, keeps it sufficiently easy at its connection with the cover, to move steam-tight and free; and further, that only slight changes of the bar are required to regulate this connection, under the requisite inclination. It is also manifest that the valve, being so held in connection with the cover and bar when the steam is on, is relieved from that connection when the steam is shut off. It then falls away from the bar and cover, moving independently of them; and on its seat, as does the ordinary slide-valve. It is therefore exactly adapted to engines running with steam shut-off—as the locomotive in descending grades—returning again to its close connection with the bar and cover, when the steam is let on.

The unequal action of the steam upon valves at the cylinder ports is overcome in the following manner. Chamber *h*, Figs 1, 2, 3, is made in the upper face of the valve, over or opposite the exhaust chamber *g*, and of the same superficial area; also the open ways, *i i*, Figs. 2, 3, are made through the valve to connect these chambers. Recesses *f f*, Figs. 1, 4, are made in the inner face of the cover, over or opposite the steam ports c c, and of the same superficial areas; also openings *p*, Fig. 3, through the valve, for communication of steam between ports and recesses. From this arrangement of ports it is manifest that the exhaust steam, passing through the open ways into the chamber *h*; acts upon the upper and under faces of the valve with equal pressure at the same time; and that the steam acts at the ports, on the under face of the valve and at the recesses, on the upper face, with equal pressure at the same time; that it acts equally so at the suppression and compression periods of the stroke, through the communication openings *p*; and finally, that it can act upon no part of the valve, without at the same time acting upon an equal and opposite part—thus making it practically a perfectly balanced valve.

The weight of the valve is overcome by making the area of its upper face larger than that of its lower face, which is done by slightly increasing the width of the valve at the former. The increase must be the amount which, multiplied by the average pressure of the steam, shall give in pounds the weight of the valve, The upward pressure of steam then lifts the valve, and relieves it from the friction of its weight.

It will be seen from the foregoing that the valve is so adjustable as to move, whatever be the pressure of steam, perfectly steam-tight and free. The pressure of steam on every part is perfectly counterbalanced by its pressure at the same time on an equal and opposite part, and is so made as to give a lifting pressure to the steam that balances its weight. Joseph Wasseth, engineer of the Wyandotte Rolling Mills, who recommends it, says it is handled with perfect ease, is simple in construction and does not get out of order. James W. Bartlett, Superintendent of the Detroit Locomotive Works, in a testimonial speaks of an engine on which it is placed, and says it has a link motion, which can be reversed, either running or stopped with the throttle wide open, by taking hold of the eccentric rod. Mr. G. W. Reder Martin, mechanic of the Detroit and Lake Superior Copper Co., says "the faces of the valves and those it touches, polish, but do not wear." We have been shown several other testimonials of like nature, but as the practical utility of the science is so apparent it is needless to refer to them. Wiester & Co., No. 17 New Montgomery street, are agents for the valve, for this coast and will furnish further information. A model can be seen at this office.

SECTIONAL VIEW OF GROUT'S BALANCED SLIDE VALVE.

The Emperor in the American Department at Vienna.

We see by a dispatch to the Associated Press that the Emperor has made a visit to the American Department of the Vienna Exposition, and expressed himself well pleased with what he saw there. We are glad of this, because nobody else has seen fit to express themselves to that effect, and it is refreshing to know that an individual could be found, if he is only an Emperor, who could visit "our Department" without making fun of it. All the newspaper correspondents have more respect for themselves—or public opinion, rather—than to have said a word of encouragement. But then, newspaper correspondents have to strike a popular vein, and be careful what they say on account of their reputation for veracity (which, generally speaking, is well known); perhaps an Emperor is not controlled by any such considerations.

The Emperor seemed to manifest much interest in the sewing machines, and saw the original machine made by Elias Howe, asking what additions had been made. Here we might call attention to an oversight made by our Commissioners. They ought to have provided a real, live American sewing machine agent to have explained these matters to the Emperor. We could easily have spared a few thousand, and as there would have been considerable competition, they could have chosen the most efficient by turning them all into a room until the best man had "solicited" and explained all the others into a state of exhaustion. It is seldom men of this class have such "game" as an Emperor to talk to, and they would doubtless have improved the occasion and impressed his majesty with a high appreciation of our institutions, and sold him a machine at the same time. The chance, however, is lost. The Emperor is also said to have glanced at the map of Philadelphia and made inquiries concerning the location of the Centennial Exhibition Building. Undying fame for Philadelphia! it is not stated that he made any remarks about the Chicago fire, the Boston Jubilee, or the New York "Rings," so Philadelphia is ahead.

A model of the excavations at Hell Gate was shown him, which elicited the remark—"The engineering feats of these Americans are incredible." Well, really, quite complimentary. We think, however, he would have been surprised if the "engineering" feats of some of the Directors of our railroad and mining companies or political rings, had been so explained to him; for after some of them have been fully understood by parties interested and who thought they knew all about it, they surprised even them. The Hell Gate operation—was man the kind the Emperor saw the model of—would have been eclipsed. "The Emperor also visited the dental display." There, we knew we would'nt read far in that dispatch without seeing something about the "dental display." All the correspondents write about it and the editorials all mention it; and even we, who have dodged the subject systematically are obliged to speak of it Although teeth are appropriate in everybody's mouth, in connection with an exposition—especially at Vienna where everything is dear—some other subject might be touched upon than them. Nobody ever jokes about it in a dentist's chair, certainly. If the dentists of America have had the interests of their profession more at heart and have manifested a desire to have a more complete display than mechanics and others, they ought to be praised, not made fun of. If other parties had done as well, we would have something to be proud of in our Department at Vienna.

The Emperor examined the cotton, sugar and rice from the Southern States, and the Ohio, Missouri, New York and California wine exhibition; he smilingly declined a glass of American champagne, which was not complimentary to the champagne. But then he probably had better in the Imperial cellars, or else was afraid some enterprising wine manufacturer would immediately copyright a label with the Emperor's arms thereon, stating the wine was the favorite beverage of His Imperial Majesty. As they like beer better in that country, it would'nt have done to "go back on" the national drink. Among other things which are said to have interested him were a map of the Northern Pacific Railroad country, and the accompanying collection of wheat, furs and minerals; the display of American bank note engraving; the chromos; ores from Michigan, Tennessee, Pensylvania, Illinois and Indiana (California not mentioned); blocks of coal, American organs, boots and shoes, arms, etc. The arms specially interested him, as also the military saddles, accoutrements, cannon, sanitary cars, etc. Finally he said to Mr. Garretson, "For improvements and new inventions since the last exposition, America is without comparison in the entire building." In leaving, when Mr. Jay remarked that he was sorry the American Department did not fully represent the capabilities and resources of the United States, the Emperor said: "America makes a more valuable, instructive, and interesting display than she has shown in any previous foreign exhibition. Beyond that, the most noticeable feature in your display of industry and art is the constant evidence that the artificers are thinking men, and that your labor seems to increase by constant and active experience."

After the interminable muddle and fuss in the American Department of the Vienna Exposition, and the much-to-be-deplored circumstances connected with the first Commission appointed, it is gratifying to know that the Emperor was "impressed" with what he saw there. The Britishers have been trying to "impress" another potentate—the Shah—by showing him their own country, manufacturing industries in full blast, magnificent fleets of vessels fully equipped; their systems of all kinds of things and their palaces and magnates, even to the Queen; and he wouldn't be impressed; and here has an Emperor, ruling a people of far more power and better intellectual and mechanical abilities, become "impressed" with an exhibition of American products which everybody in America has made fun of. We venture to say, however, that if any others than Americans had run down the American Department, they would have been mercilessly written down as prejudiced and bigoted foreigners, and our Department would then have been lauded to the skies. That a more magnificent and expansive display of our products would have been productive of good, there is little doubt. But if the people of monarchical governments can be convinced that "good can come out of Nazareth;" that a Republic covering a territory larger than all Europe, and which has existed nearly one hundred years under that form of government, has made most rapid progress; that our people are skilled mechanics and artizans, and want more skilled mechanics and artizans; that there is a large extent of country abounding in latent riches and needing population; that we can manufacture certain things they need and can make them better and cheaper than any one else; that our machines are in advance of those of older countries, and our implements, labor-saving and economical, —then will we have reaped some reward from our show at Vienna, meagre as it is.

Cuproscheelite.

At the last meeting of the Academy of Sciences in this city, Mr. H. G. Hanks presented a specimen of the mineral Cuproscheelite, and read a paper describing its peculiarities. The mineral was found in the Green Mountain mine, Kern county, Cal. The mineral looks like sulphate of baryta colored by an admixture of some foreign substance. The analysis made, however, by Mr. Hanks, proves it contains no baryta. Although the mineral strongly resembles Scheelite, yet the presence of copper and its inferior specific gravity separats it widely from that species. A microscopical examination was made by Mr. Hanks to ascertain if the copper might not be a mechanical mixture, but it was found to be perfectly homogeneous. It was described by the State Geologist in volums 3 of the Academy's proceedings, page 287. Although not new, it is quite interesting to science as coming from a new ocality and being found in abundance. As a sourcs of Tungstic acid it will be valuable to the Arts, as according to the analysis of Professor Whitney it contains 79.69 per cent. of thet rare acid and is easily decomposed.

Mr. Hanks presented also a sample of Tungstic acid, obtained by simply boiling the mineral in hydrochloric acid. This is the first ever made in the State. Scheelite has been observed in the Memmoth District, Nevada, and Cuproscheelite in several mines in Lower California, but we are not aware that there is any known locality in which Tungstate of Lime in either form is found in any considerable quantity. According to Professor Whitney, Cuproscheelite has the following composition:

Tungstic acid	79.69
Oxide of Copper	6.77
Lime	10.95
Protoxide of Iron	.31
Water	1 40
	99.12

ENTERPRISE. — The Enterprise Company, operating at Smartsville, says the Grass Valley *Union*, will soon have the great tunnel completed, and be ready for washing rich gravel. The flume is a mile and a quarter long, the greater portion of it being in the tunnel. The flume is four feet wide and thirty inches deep. It will be paved with stone. The tunnel is eight feet high, and seven feet wide at the bottom. The tunnel has cost something like $100,000. In its construction about $12,000 dollars worth of Giant Powder was used. The work has been in progress about three years. When the flume is completed it will require $10,000 worth of quicksilver with which to charge it. The Enterprise has a great body of gravel, which prospects well from surface to bed-rock.

A DIAMOND DRILL, belonging to the South Aurora Mining Co., of White Pine, is to be put at work on Chloride Flat to ascertain whether ore exists at any depth in that locality.

THE new mill at Mineral City, Robinson District, Nev., will shortly be completed and ready for crushing.

THE White Pine Office of Wells, Fargo & Co. shipped, during the month of June, $71,071 in bullion.

Inventors Among Kings.

By George W. Bungay.

Welcome inventors; step aside,
Ye sons of sloth and empty pride:
Open the doors of welcome wide,
Escort inventors to the seat
Where royal guests sit side by side,
And princes amid plandits meet.

They shorten weary hours of care,
They lift the hurdens that we bear,
They speed us on the thoroughfare,
They multiply our hours of rest,
They give us leisure hours to spare:
The inventor is a regal guest.

There is no head that wears a crown,
Though lifted high, that should look down
On faces bronzed and fingers brown
Of men of skill and genius rare;
For they have won a grand renown
Kings might be proud and glad to share.

Inventors are the kings to-day,
Uncrowned, they hear a regal sway;
Their mandates winds and waves obey,
And gases yield obediently;
The lightning on its wiry way
Their message takes o'er land and sea.

Where is the prince in purple horn,
Where is the head a crown has worn,
Where is the king, bright as the morn,
That has devised a noble plan
To ease the hurdens we have borne,
And elevate the race of man?

Is there a genius on a throne,
One crowned Inventor, to atone
For mediocre men, who soon
Must put aside the crown and stave?
What shall we write upon the stone
That stands above a monarch's grave?

Who taught the rivers how to spin,
And weave the varied colors in,
With fabrics manifold and thin,
So that the pulsing shuttle flies
Fast as a heart that beats to win
A living, loving, mortal prize?

Who made two blades of grass to grow
Where one before was faint and slow?
Who sent the engine out to mow
The verdant meadows smooth and clean?
Was it a noble duke whose brow
Has won the wreath of fadeless green?

Who taught the millers how to find
The finest flour in grains they grind,
So that the mill obeys the mind,
As it did not in days of yore—
No starch, no gluten left behind,
And men are fed on husks no more?

Eureka Consolidated Company's Mines.

We yesterday visited Ruby Hill, for the purpose of taking an internal view of some of the leading mines of tbe district, which are thereon located. We bad miscalculated the task, and, after several hours of climbing throngh the laharyntbs of drifts, cuts, winzes, etc., of tbe Eureka Consolidated mine, we found onrselvee considerably exbausted, and the afternoon far advanced. We were therefore obliged to give over the investigation of the merits of any other claims till another day, and to slight a considerahle portion of the mine which we were permitted to enter. We also made a lamentable mistake in not donning our commoneet attire, for we carried away on and about our garments a larger quantity of red oxide, chloride, bromide and other "idee" than we had any use for.

When the men bave heen lowered to their respective stations, after 12 o'clock lunch, we entered the

Lawton Shalt

In company with Mr. Lamb, the gentlemanly foreman, in whoee care Mr. Ellsworth had given us. Thie shaft is down a depth of 300 feet, with four main dritts. Descending to the hottom, we entered the first of these, which is run a distance of 230 feet, but which developee nothing of interest tbus far, except some very flattering indications at its extremity. Work upon its prolongation is heing continued. The first cross-cut is in about fifty feet. Nothing particularly noticeahle has heen bronght to view here, hut, from mathematical calculation in relation to the body of ore, the whereabouts of which ie already known, it is expected that something of consequeuce will he found in the next twenty-five teet. The second cross-cnt, counting from the main shaft, has been pnshed forward somewhere near seventy feet, and shows fine prospects, but nothing in particular beside. The third is the most important cut from thie level. It has a lineal measurement of 200 feet, with

A Fine Body ot Ore

at the furthermost working, which has been brought to light within the past few days, and which assaye considerably into tbe hundreds. Its extent, of course, has not yet heen ascertained; but developments hy an eight-hour ehift are going on with speed. Already a face of fine miueral, which measures, laterally, perhaps twenty feet, hae heen exposed. A small winze is being driven from the mouth of this cut, to connect with the level above, for the purpose of ventilation. It has already been carried up sixty-five feet, at an angle of eighty degrees from a horizontal, or ten degrees from a perpendicular. At present air is forced in through a small ruhher hose from the vicinity of the main shaft hy a hellows worked by hand. After completing our eurvey of the lower workings, we stepped upon the cage and were hoisted to

The Third Level,

which is 220 feet from the surface, and which is carried in horizontally ahout 300 or 400 feet. Tho work of ite continuance is being carried on, with encouraging prospscte ae explorationo proceed. Tbe workmen are coming into iron indications, which ie considsred a favorable prospsct for silver, ae the former metal ie an inevitable accompanimsnt of the lattsr, but tbe latter not necessarily of the former. Ths first cross-cut from this drift is about fifty feet in length, from which high grade ore ie heing taken in large quantities. There is no estimating the extent of the argentiferons deposit which this cut has tapped. Ae far as ths developments have proceeded, nothing hnt ore has beon encountered. Ths second cut from this drift has heen completed for abont 400 feet, and is dsaigned to intercept the workings from the Windsail shsft. It is daily anticipated that ore will he met with in the explorations here, the indicatione upon tbe snrface ahove thie point leading to or warranting that expectation. Three ors shntes come into this drift from ths level ahove, from whicb the metalliferous suhstance is taken in ahundant quantities.

This finishes onr observations in this locality, and we ascend to

The Second Level,

Wbich ie 170 feet from tbe surface. The work upon this drift is going rapidly forward, the Superintendent and foreman being incited by the prospect of exposing something worthy of a vigorous effort, from the indicatione which appear upon tbe surface perpendicnlarly above. The first exploration at right angles with thie has been abandoned. The eecond cross-cut has been carried in 200 feet, with the double desigu of prospecting the vicinty of the Buckeye and Mammotb grounde, and of affording increased ventilation. The fourth cnt measures thirty feet, and exposee one of the moet perfect walle anywhere to be seen. It presents a surface ae smooth as that of tbe hard-finished wall of a huilding, and nearly as perfect a plane.

The first level possessee no interest at all, being nsed for carrying the ore from the point of its intereecting the main shaft to the surface below the hoisting works.

We next visited the

Windsail Shaft.

This hae a perpendicular exteut of 225 feet. Buckets are ueed instead of a cage in hoieting and lowering, although the latter more convenient apparatns is upon the ground, and will be in place in a few days.

The first level is 86 feet from the surface, ie 75 feet in extent, and throngh ore the whole distance. Tbe formation is very irregnlar, aud the workinge also in consequence. An immense body of rich ore is presented to the view of the spectator in this level. A new station is being opened here. Another drift ie run in upon the same plane as the first, which also develope nothing but a high grade of argentiferous formation. Another drift ie carried in from the eame level, which, like the other two, is run through nothing but ore. This immense hody eeems to have a dip to the eastward, so far as the explorationo will allow such an inferences, and a strike north and south, or very nearly so. It ie impossible to give a comprehensihle delineation of the maze of irregular shaped cavitiee that are met with in climbing through the workings of the Windsail. Incredibly large bodies of ore are met with on every hand, and, to the nnaccuetomed one looking throngh, eeem to have no tangible heginning or end. Some drifts are run below this one, which are also intended to investigate in the direction of the Buckeye and Mammoth locatione. These latter claims we did not see, hut were told by the foreman that they are of promieing merit.

We cannot couclude our account of this splendid piece of property withont remarking the sagacity and untiring vigilance of the Superintendent, Mr. Ellsworth, in the management of the mines and furnaces of the company which he represents. The most perfect syetem is everywhere to be noticed in the conduct of affaire, both at the Hill and at the furnaces in town. The number of men employed at the mines is in the neighborhood of 225.—*Eureka Sentinel.*

Gold in Indiana.

A correspondent of the Indianapolis *Journal*, gives the following glowing account of tbe new diecoveries in Morgan County, Indiana. An hour's ride over tbe Vincennes road brought us to Centreton, where we disemharked and took paseage in a spring wagou which we found waiting at the depot.

A jolting ride of three hours over hille, along and through Sycamore Creek, past steep, perpendicular cliffe of eolid rock, brought ue to the mouth of Gold Creek, the entrance to the El Dorado of Indiana, the Stafford farm. In reaching this spot we pasa what is called the Landers farm, wbich the company owning the mines have leased for a term of years. There we first hegan to discover unmistakable gold signs in innumerable pocket collections of emery or black sand washed from the gulches hy tbe late raine.

The Stafford farm embraces 130 acres, through which runs Gold Creek, while Sycamore Creek horders it on the left and a deep gulch on the right.

As we disembarked from the wagon we were introduced to Dr. Voilee, of Kokomo, who ie an old California miner and part owner and snperintendent of theee mines. Under hie gentlemanly supervision we partook with a keen relish, of a hountiful repaet, and then began our investigation.

Tbe first thing that Captain Tinkbam'e eye lit npon, wae a magnificent specimen of roee qnartz, the possession of which we all eecretly envied him. Our atteution was first given to the washings.

Every pan of soil produced grains of gold ranging from ten to fifty in number, and averaging abont the sizs of a pin head, forcing the conclneion into the mind of the most eceptical that gold was there, not tbrough the agency of man, hut through the workings of Naturs, and that in eufficient quautitiee to richly compensats those who sek for it. Dr. Voiles informed us that he has been prospecting most of the tims since last April, and his lowest estimats is that miners can make from six to ten dollars a day, with a glowing prospect in view of strikiug pockets that will yield almost fahnlouea monnts.

An aged native of that section, who epende mnch of hie time eeeking for gold, ehowed ns a nnmber of pieces which he had picked np that day, and which were of sufficient value to fully justify tbe tims expended. Captain Tinkham and Rev. Mr. Walker took a stroll up the gulch; the former picked up two good sized pieces, ths largest, in fact, tbat were found that day, one of which wae lying on a naked rock, in plain sight.

The Geology of Nevada.—On the trial of the miniug euit involving tbe Richmond and Enreka Coneolidated, a short time ago at Eureka, Prof. Clarence King was examined at length tonching the location and character of the ledge or deposits. His idea of the geological structure of the interior baein is shown in the following extract: The geological formation of Ruby Hill is quite a simple one, the main mass of the hill being formed of an underlying bed of quartzite, which is capped by transition etrata of silicions limestone, and followed upward by heavy bede of crystaliue metamorphic limeetone. Thie hill, from its evident connection with the other mountains of the region, is the eroded fragment of a fold or mountain uplift. The etrata of which it is composed are eubmarine in origin. They belong, as ie shown by fossils discovered here in them by assistants of my own, to the silurian and devonian period of the stratified rocke. These fossils also show that it was an oceanic desert. Other geological evidencee gotten in here, and throughout the Great Basiu, sbow tbat these strata were lifted from their eubmarine position at the close of the triassic period, and folded into mountains and permanently lifted above the level of the sea; in fact, at tbat time they reached their present attitude above the level of the Pacific. Suoh an immense uplift ae thie, with the consequent pressure in tbe axes of tbe folde, produces two great effects; the metamorphism of the strata and the fiseuring of the strata. Conuected with such deep-eeated fieeuring as must neceeearily take place in the folding of beds, whicb onr survey hae proven to be 30,000 feet thick, the fissures must necessarily penetrate to a great deptb, and that tbey have heen penetrated to a great depth is proveu by the deep-seated chemical action which has made itself evident througb these fiseuree, resultiug partly in mineral veine, partly in metalic mineral veins of lodes. In this especial instance, the evidence of uplift is present in the inclination of the main hede of the formation. The evidence of fissuring is present in the dislocation of strata, tbe presence of planes of fiseuring, of cavities and of striation of surface, indicating actual faulting. So far as that goes, we have them up to that point of the euhmarine deposit lifted high into tbe air, metamorphosed and riven with fissuree.

Opening of a New Mining Region.

It is eaid that within the past year an important mining enterprise has bsen planned, and is now almost eousummated, eo far ae the acquieition of the mines and water-rigbte is concerned. Tbe project involves the damming of tbe watere of the Middle Fork of the American River, near its source; tbe huilding of large reservoirs, and a ditch sixty miles in length. The water is to he carried down to Iowa Hill, Yankee Jim's, Wisconsin Hill, Little York, etc. The region is eaid to he very rich in auriferous deposite; but scarcity of water bas hitherto prevented the development of its resonrcee. By means of the main ditcb and its hranches 5,000 inches of water per day can be introduced, which will admit of a sufficient nnmber of claims heing worked hy bydraulic and other processes in which water is the chief element used, to give work to from one to two thousand men. The result will be a permanent revival of mining. The Central Pacific Railroad rune within some tbirty miles of tbe locality to which the water is to he brought. Toll to the amount of nine dollars ie now levied on a two-horse team on the fifty-mile drive between Anburn and Iowa Hill, and etill higher rates are charged on heavier freight teams. To avoid theee chargee, wbicb amount to ahout one cent per pound on all goods shipped from Auhurn, it ie proposed to huild a wagon road from Summit Valley, which is only fifteen miles from the Middle Fork of the American River, at tbe point where the reservoirs are to he built.

Some $250,000 has been already expended in the purchase of various watei rights and mining claims. It ie anticipated that the ditch and reservoire will cost abont $450,000, and that they can be completed within ahout a year and a half. The firet gang of lahorere and mechanice will be put to work in ahout three weeks.—*Call.*

Cortez District.

Tbie district is situated in Eureka county nsar the Lander line, and ahout twenty miles eouth of Bsowawa station, on the Cantral Pacific Railroad. J. E. Lucas, who has jnst returned to Piochs from Cortez district, givse the editor of ths *Record* some particulars relativs to the minee of that important camp. The first mile in ths district wae found in 1863, in which Tom McMastsrs and Winburn wsre original locators. A company wae organized soon after, and machinery brought from Sau Francisco at the rate of 37½ cents per ponnd. Tbis, with other expensee and the various "perquieitss" exacted, ewamped the company, and the members were compslled to abandon the mine. Every one left ths camp except Winbnrn, who, with his family, hae weatbered the etorm for ten ysars. At intervals, howevsr, the chloridizing procees has heen engaged in by differsnt parties since the minee were first discovered. In early days ores were taken to Auetin, 75 miles dietant, and converted into bars and bullion. For three yeare or over Winburn has been running a ten-stamp mill, which hae been found ample to accommodate the few who made the experiment in that district. With anything approaching a development of this camp'e resources, the mill-power will have to he increased ten-fold in order to rednce to bullion and bare the yield of these mines. Wood and water are fonnd close at hand, and in the greatest abundance. The moet prominent mines in the district are the Garrison, Nevada, Giant, St. Louis and Taylor, and Passmore, besidee those owned and worked by J. E. Lucas, Amos Johnson and John Hanrehan, all of Pioche, from tbe former of whom we ohtained eome interesting data concerning Cortez district. The minee owned by Lucas and his partners are the Modoc and Richmond eilver mines, and the Mammoth, a copper mine. Enough work has been done on the Modoc and Richmond to hold them under the law of Congress and tbe mining laws. The Modoc has yielded ore aeeaying from $100 to $500, and the Richmond about the same. The Modoc ledge ie 28 incbes wide, and the Richmond 33 inches. The Mammoth (copper mine) showe a hody of ore ten feet wide on the surface, and experts aesert that tbe yield will be from 25 to 80 per cent. The silver minee, however, engage the greatest attention. It is the purpose of Mr. Lucas and hie companione to return to Cortez district at once, being now eatisfied that the minee are rich, and having secured the required capital for their complete development. The Cortez district will be heard from again.—*Eureka Sentinel.*

Carson River and Its Waters.

Dnring the past few daye the water in Careon River has heen failing very rapidly, though a eufficiency etill remains to run all the mille. There is said to be an abnndance of water flowing from the monntaine to keep the mille running constantly all through the enmmer and fall, if it were not wasted by many of the ranchmen, who let it run away npon eterile lands, where it sinke into the eands and never finds its way hack into the river. The millmen do not object to the ranchmen making uee of all the water they require for the irrigation of the fields they have under cnltivation, as the supply is ample at all seasons for both that nse and for the driving of the mills, but they do not like to eee tbem turn water away from the river and never tnrn it back. Only euch persone as owu lands lying along and hordering on the river have a rigbt to its waters for the purpose of irrigation, yet it is said that some of tbese fnrnish water to those pereone who are farming far inland, ae it were, and tbe water thns taken away never gete back into the river. Now that the rights of the ranchmen are recognized, they should waete ae little water as possihle, and, after using what they require, ehould do all that lies iu their power to keep the mills going. Up to 1855 and 1856, and even later, tbe decisions of the Courte on tbe Pacific Coast always favored the minere and fostered the mining intereet, often greatly to thc inconvenience, and much to the discomfiture of the ranchmen; since that time, however, these decisions have been mucb modified, and the rights of the tillers of tbe soil have been recoguized. It is to the interest of the ranchmen tbat the mines and mills shonld be kept going, and it ie also for tbe good of the miners and mining population that as much arahle land ae poseible ehould be cultivated in their neighborhood. Tbere has prohahly been eome increaee in the volume of water flowing in the Careon during the past day or two, as the cool weather, by checking its evaporation, always prodnces a noticeable augmentation of the eupply; yet should a ecarcity occur, the ranchmen located up toward the headwaters of the stream should do all in their power to keep every stamp of every mill in uninterrupted operation.—*Enterprise.*

At the Thompson mine on Pine Flat, eeven milee south of the Geysers, owned by Thompeon Brothers, a tunnel is in 140 feet, and fine ore and a rich prospect are already developed. It takes a good deal of money to open a mine; tbe Reddington Company, it ie eaid, have epent $100,000 on theirs before they got any return. The money comes back now, however, as it will from many others of our local minee with a little more development.

The Mining and Scientific Press Marching Onward!

Our careful system of compiling, judiciously condensing, and conveniently arranging into regular departments, has been heartily endorsed. It renders the paper worth more to readers, who can find handily the which interests them most.

The weekly issues of the Press will contain reliable

Information for Practical Miners,

Treating on the Opening of Mines; Mining of Ores; Milling of Ores; Smelting of Ores; Separation and Roasting of Ores; Amalgamation; Saving of Gold and all precious Metals; New Processes of Metallurgy; New Discoveries of Mines; Mining Engineering and Hydraulics.

For Inventors, Mechanics and Manufacturers.

All new and important developments in Scientific and Mechanical Progress; Patents and inventions of the Pacific States; Progress of Home Industries; Hints for Local Manufacturers; Illustrations of New Machinery; Reports of Popular Scientific and Industrial Lectures.

Our Mining Summary

Gives the progress of mining work from week to week in the various counties and districts throughout the principal mining regions of the United States, arranged in alphabetical order. It is the most extensive record of mining operations published in the world. It affords the intelligent miner a rare opportunity to know and profit by the work and experience of his neighbors. Miners have few sources of practical information in their calling, and should embrace every reliable means for improvement. Mining Operators and Shareholders, at home and abroad, weekly examine our Summary with increased interest and profit.

Our "Domestic Economy"

Embraces new and important facts which should be known in every cabin and household. Short and interesting—the articles under this heading are freely read and practiced with profit and improvement to the readers.

The Press is not strictly a "paper for professional, scientific men," but rather a

Liberal and Popular Scientific Journal,

Well calculated to make practically scientific men from our intelligent masses. This is our stronghold for accomplishing good. Plain, correct and pleasing language, easily comprehended by all, confined mostly to short articles, is our endeavor.

For Self-Improvement,

Every issue of the Press abounds with articles of an elevating character, to stimulate the higher virtues and natures and progressive intellects of both men and women.

Hundreds of Dollars

Are oftentimes saved to the readers of this paper by a single hint or article of information in its columns. Such instances have been repeatedly reported to the editors and proprietors during their long connection with the Press. Our paper presents

The New and Novel Developments

In the progress of this comparatively new section of the Union (but recently settled and now rapidly increasing with a population of the most intelligent and venturesome people, attracted from nearly every quarter and clime on the globe), enable us, with due enterprise, to display vigor and freshness in our columns not met with in similar journals elsewhere. The same circumstances also render such a paper more especially valuable to its readers in a new, and to a certain measure, untried field, where the best methods and processes of industry are not so well established or traditionally known as in older communities. Published experiences often save costly experiments and disastrous results.

A Great Variety of Industrial Information,

In brief and fresh form, suited to the wants and tastes of the readers of this coast, which is not obtainable otherwise so timely, or in so cheap and convenient form. As an industrial publication, meeting the wants of so many kindred industries, this journal stands pre-eminent and without a precedent.

Subscriptions payable in advance—$4 per annum. Single copies, post paid, 10 cents. Address

DEWEY & CO.,
Mining and Scientific Press and Pacific Rural Press Office, 338 Montgomery St., S. F.

Valuable Premiums for Subscriptions.

A Sewing Machine of Real Value (Beckwith's) given for $40 worth of Subscriptions.

The American Agriculturist, in speaking of this Machine, says:

We are prepared to indorse the Beckwith Sewing Machine as one worthy of being at once secured by all who cannot purchase the expensive machines.

1st. It is well and strongly made.

2d. It is easily attached to any table or stand having a leaf or edge projecting an inch or so, and can thus be used in any part of the house, near a window, etc.

3d. It makes the elastic loop stitch (the same as the Willcox & Gibbs and some other good machines), which with a little care in making the closing stitch is abundantly strong for nearly all kinds of sewing, and less liable to break in washing and wearing, owing to its elasticity.

WE WILL GIVE

For $12, a Machine and the Illustrated Press, 1 year.
For $12, a Machine and the Mining & Scientific Press, 6 mos.
For 12, a Machine and the Pacific Rural Press, 6 mos.
For $13.50, a Machine and the Mining & Scientific Press, 1 yr.
For $13.50, a Machine and the Pacific Rural Press, 1 year.

For $40, we will give a Machine and $40 worth of subscriptions to either paper or all jointly at regular rates. Send for Circular.

Express charges must be paid by the purchaser. Address, for further particulars, the PUBLISHERS OF THIS JOURNAL,

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 338 MONTGOMERY STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Victoria, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Grenada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule prices for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country SOONER than any other agents.

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing them to the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applications which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents, or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more directly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventor of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.,
United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 338 Montgomery St., S. E. corner of California St., San Francisco.

SWISS AMERICAN BANK,

Incorporated in Geneva, Switzerland, January 20th, 1873.
HEAD OFFICE IN GENEVA.

CAPITAL, TWO MILLION DOLLARS

An Assay Office

Is annexed to the Bank. Assays of gold, silver, quartz, ores and sulphurets. Returns in coin or bars, at the option of the depositor. Advances made on bullion and ores.

Dust and bullion can be forwarded from any part of the country, and returns made through Wells, Fargo & Co., or by checks. 1v27-3m

TO BUILDERS AND ARCHITECTS.

Brooklyn Freestone Quarries,

Three miles from the Brooklyn R. R. Depot and Landing, and 4½ miles from Oakland City Hall.

Having just completed a good road to these quarries, we are prepared to furnish large or small orders for either dimension stone, or rough stone, in San Francisco, Oakland, or Brooklyn, at such prices as cannot be competed with, for equal quality of stone; for base and elevation walls, for public and private buildings, monuments, fence walls, coping, window caps and sills, doorway trimmings and steps, stepping stones, curbing for streets and sidewalks, pavements for streets and street-crossings, bases for gravestones and plain and ornamental work for cemeteries, etc.

We can furnish cellar and basement walls of rough stone of superior quality in San Francisco at about the cost of brick work for the same.

The gray freestone from these quarries is considered far superior to that of any other within practical distance of San Francisco. It is readily worked and imperishable.

For samples we refer to the first story of the City Hall, Oakland, erected four years since, and the window caps and sills, and other finished work in the Deaf and Dumb Asylum, Oakland; in the Oakland Cemetery around the lot of J. S. Emory. Also small specimens in the offices of Augustus Laver, (Architect of the S. F. City Hall) Kearny St.; David Farquharson, Architect, Cor. Kearney and California St., S. F.

Orders may be left with George W. Thompson, on the premises, or A. T. DEWEY, SCIENTIFIC PRESS office, No. 338 Montgomery St. S. F., where samples of the stone may be seen.

THOMPSON & DEWEY.

(Continued from Page 53.)

and stringers of quartz are frequently encountered that give rich assays, and expectations are entertained that a body of good milling ore will be developed soon.

CROWN POINT EXTENSION.—Sinking the new shaft is making excellent progress, the rock in the bottom working finely.

EMPIRE.—The up-raise of the 1600-ft. level is making excellent progress, with no change of interest to report. The east cross-cnt on the 1700-ft. level is being energetically driven ahead.

LOWER COMSTOCK.—Sinking the shaft is making good headway. The rock in the bottom blasts well, and the hoisting will soon require steady hoisting works, which are now ready for erection.

JACOB LITTLE.—Work in the lower tunnel is steadily progressing, the drifts from the second cross-cut in the ledge developing some good ore, assaying well in both gold and silver.

DANEY.—Sinking the shaft is making excellent progress, the rock in the bottom working well, and no water to interfere. It is now down a depth of 110 ft.

PICTOU.—Driving the main tunnel is making good progress, occasionally cutting feeders and stringers of rich ore, which indicate a near approach to the main ledge.

OVERMAN.—The prospecting drifts west at the 1000-ft. level are still driven energetically ahead.

YELLOW JACKET.—Prospecting the 1400 and 1500-ft. continuee, without change of interest to chronicle.

GREEN.—Work progressing steadily, with some favorable indications of good ore developmente soon.

CROWN POINT.—Daily yield, 400 tons of ore. The north winze, on the 1,300-foot level is down 20 ft., the whole distance through rich ore, the assays running as high as $149 to $154 per ton, nearly one-half being gold. The middle winze, 1,300-foot level, is down 18 ft. also in good ore. The south winze, same level, is down 14 ft. in rich ore, and strong indications of water. The drill holes in the face of the east cross-cut, from the main south drift on the 1,400-foot level, have been driven 19 ft. into the face, the flow of water steadily increasing until it is all that the pumps can do to handle it. The machinery is working well, and a steady increase of the daily yield may be expected.

BELCHER.—Daily yield, 500 tons. Incline down 199 t. below the 1,200-foot ft level; still sinking. Stopes looking remarkably well. Cross-cutting east and west; n 10 ft. on west side and 11 ft. on the east, making a width of 21 ft. General appearance of the mine more flattering than ever. The second cross-cut south, 305 ft. feet from the Crown Point line, is in 9 ft., encountering fine ore all along. The ore supplies are holding out wonderfully; could take out more ore daily, did the working capacity of the mills warrant so doing.

CONSOLIDATED VIRGINIA.—Sinking the shaft was suspended some four days during the week for the purpose of making some necessary changes and repairs to the machinery, but was again resumed yesterday. No progress whatever has been made with the main north drift on the 1,167-foot level since our last report. The strong flow of water continuing from the face of the drift, keeping the men husy taking away the sand and other matter forced down by the flow.

KNICKERBOOKER.—Cross-cutting from the main southwest tunnel, on the 400-ft. level, is making excellent progress, the face of the drift still in quartz, which show some excellent indications of good future ore developments.

BALTIC CONSOLIDATED.—A strong force of men are employed, and the work being driven ahead in an energetic manner. Driving the main tunnel is making good headway, from which some ore was taken during the week that gave excellent assays, and promises some good developments. Sinking a new shaft has been commenced and is making good progress.

NEVADA.—Work on this mine progresses well, the rock in the new shaft is hard but works well; the shaft is thoroughly timbered and is one of the best three-compartment shafts on the Comstock. Some ore worked at the Ramsdell & Thompson mill last week, from the old works milled over $17 per ton. The compsny anticipates putting up a mill on the claim; they have plenty of water and every facility for crushing the ore and making it a dividend-paying mine.

HALE & NORCROSS.—The north winze on the 1,700-foot level is down 110 feet, having encountered no ore of value to that depth. Bad air greatly interferes with the progress of the main south drift on this level. Daily yield 40 tons of ore, mostly from the second station, 800-foot level.

WOONVILLE.—The winze in the main south drift at the third station is down 40 ft. on the ledge, which is gradually widening, and the ore improving in quality as a greater depth is attained. The ore stopes at the first and second stations continue to improve in both the quantity and quality of ore produced. The lone mill is kept steadily running on ore from the mine.

GOULD & CURRY.—Daily yield 15 tons of ore from the old upper working. The main northwest drift on the 1500-ft. level is still driven ahead in quartz of a very promising character. Prospecting on the other levels continues with unabating vigor, nothing new to report.

WHITE PINE.

THE EDGAR MINE.—White Pine *News*, July 19: Still maintains its reputation as an ore producer, and is constantly increasing in richness and extent.

THE MILL AT ROBINSON.—We learn that the new mill at Mineral City will soon be finished and ready to commence the crushing of ores.

BULLION SHIPPED IN JUNE.—We were informed by George Haight, Wells, Fargo & Co.'s agent at this place, that bullion amounting to $71,071 88 had been forwarded through their office during the month of June.

FROM MONTE CRISTO.—We met Capt. Merriam in town during the week from Monte Cristo mill. He informs us there is no prospect of starting the mill this season.

TRENCH MINE.—In this mine the prospect for a large and productive property was never better than now. At the present writing, quantities of magnificent ore are being extracted, and work is being pushed steadily shead.

THE SOUTH AURORA Company intend putting their diamond drill at work on Chloride Flat immediately. Mr. Jeffries will assume charge of the drill. Great expectations were formerly indulged in respecting the result of the experiment and we trust that this trial may prove the fact that ore exists at a depth at this point.

REPAIRING.—We notice a move towsrd the repsiring of the Big Smoky mill during the past week. It is ssid that the mill will be put in complete running order. We also hear that a start will be msde within s short time on ore from the Edgar mine.

Utah.

NORTH STAR DISTRICT.—S. L. *Tribune*, July 11: HICKORY MINE.—In this mine the drift west is looking very fine, with about 7 ft. of good ore. The connection between this level and the Oakland east drift will be made during the coming week;

The ore in the Oakland drift is from 4 to 5 ft. wide, and is of the same high grade as heretofore. So soon as the connection is made, the Superintendent says that he will sink a winze upon the main body of ore, which widens in places to a width of 12 ft., and he will then commence stoping. On the various dumps there are between 700 and 800 tons of ore ready for treatment so soon as the mill is in operation, the machinery for which is already ordered, and is expected to leave the foundry by the end of July.

At Shanties Springs, a distauce of 6 miles from North Star, 10 smelters, of a capacity of 10 tons each per day, are in couree of erection and nearly completed. They were expected to be finished this week, and will furnish a market for ores from this and surrounding camps.

OPHIR MINING DISTRICT.—S. L. *Tribune*, July 16th: Mr. Edward S. Blackwell, manager of the Ophir Mining and Smelting Co. of Utah (Limited), yesterday showed us a very rich specimen of ore from a new discovery in the Defiance mine, on Lion Hill. It is composed of chlorides, sulphurets and native silver, and assays ss high ss $7,000 in silver to the ton,

Time Tests the Merits of all Things.

1840 For Over 30 Years, 1873

PERRY DAVIS'

PAIN-KILLER

Has been tested in every variety of climate, and by almost every nation known to Americans. It is the constant companion and inestimable friend oi the missionary and the traveler, on the sea or land, and no one should travel on our *Lakes or Rivers without it.*

Since the PAIN-KILLER was first introduced, and met with such extensive sale, many Liniments, Reliefs, Panaceas, and other Remedies have been offered to the public, but not one of them has attained the truly *enviable standing* of the PAIN-KILLER.

WHY IS THIS SO?

It is becanee DAVIS' PAIN-KILLER is what it claims to be, a Reliever of Pain.

Its Merits are Unsurpassed.

If you are suffering from Internal Pain, Twenty to Thirty Drops in a Little Water will almost instantly cure you. There is nothing to equal it for

Colic, Cramps, Spasms, Heart-burn, Diarrhea, Dysentery, Flux, Wind in the Bowels, Sour Stomach, Dyspepsia, Sick Headache, &c., &c.

In sections of the country where

Fever and Ague

Prevails, there is no remedy held in greater esteem. Persons traveling should keep it by them. A few drops, in water, will prevent sickness or bowel troubles from change of water.

From foreign countries the calls for PAIN-KILLER are great. It is fonnd to

CURE CHOLERA WHEN ALL OTHER REMEDIES FAIL.

WHEN USED EXTERNALLY, AS A LINIMENT, nothing gives quicker ease in Burns, Cuts, Bruises, Sprains, Stings from Insects, and Scalds. It removes the fire, and the wonnd heals like ordinary sores. Those suffering with RHEUMATISM, GOUT, or NEURALGIA, if not a positive cure, they find the Pain-Killer gives them relief when no other remedy will.

It Gives Instant Relief from Aching Teeth.

Every Honse-Keeper shonld keep it at hand, and apply it on the first attsck of any Pain. It will give satisfactory relief, and save hours of suffering.

Do not trifle with yourselves by testing untried remedies. Be sure you call for and get the genuine PAIN-KILLER, as msny worthless nostrums are attempted to be sold on the great reputation of this valusble medicine. ☞ Directions accompany each bottle.

PRICE—25 cts., 50 cts., and $1 per bottle.

THE NEW U. S. MINING LAWS.

The new Laws of 1872, governing the location snd purchase of Placer and Quartz Mines and Agricultural Lands in Mining Districts of the U. S., printed in circular sheet, for sale at this office. Single copies, 25 cts. Usnal discount to the trade.

NO LIFE INSURANCE COMPANY has a better record of more permanently popular reputation than the CONNECTICUT MUTUAL LIFE INSURANCE Co. J. B. Roberts, 315 California Street, San Francisco, is general agent for thie Coast. Send to him for circulars and information of this reliable, first-class company.

Mining and Other Companies.

Owing to the time necessary to mail the present large edition of the M. & S. Press, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Angels Quartz Mining Company---Principal

psl place of business, 408 California street, San Francisco. Locstion of works: Angels Mining District, Cslaveras County, California.

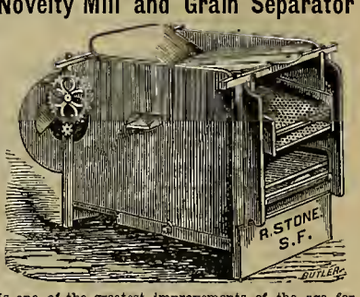
THE PATENT

Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

For further information apply to

R. STONE,

3v6-3m-eowbp 422 Battery street, San Francisco.

CROCKER'S PATENT

TRIP HAMMER QUARTZ BATTERY.

The inventor having perfected and tested the durability and capacity of these Batteries to his entire satisfaction, is now ready to manufacture and guarantee them. Parties in want of a Battery cannot find their equal in regard to PRICE, WEIGHT, CAPACITY, POWER TO RUN THEM.

BURLEIGH ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A.....Hell Gate Tunnel, L. I.
Mess. Shanley.....Hoosac Tunnel, Mass.
J. Dutton Steele.....Nesquehoning Tunnel, Pa.
Sidney Dillon.....Fourth Avenue Work, N. Y.
Col. Rochling.....East River Bridge Company, N. Y.

To Capitalists and Hydraulic Miners.

PATENT SELF-CLEANING SLUICE.

This new and useful invention is designed to collect all the gold as fast as it is set free from the dissolving earth, and conduct it into a receptacle of mercury or safety pocket, under lock and key, from whence it may be removed in a few moments, without either checking the flow of water or interfering in the least with the washing.

The invention, if properly placed in our rivers, will also collect the gold which is yearly traveling down their channels, thus affording an annual income with a trifling expense for attending.

For further particulars address

DR. J. B. BEERS,

SAN FRANCISCO GOLD AND SILVER PLATING WORKS,
655 Mission street, San Francisco.

2v25-3m E. G. DENNISTON, Proprietor.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS]

By Special Diepatch, Dated Washington, D. C., July 22d, 1873.

FOR WEEK ENDING JULY 8TH, 1873.*

TRANSMITTING TIME MOVEMENT TO DISTANT DIALS.—H. J. Wenzel, San Francisco, Cal.

SCREW POST FOR ELECTRICAL PURPOSES.—Stephen D. Field, San Francisco, Cal.

COMBINED SCRUBBING BRUSH, MOP AND WRINGER. John D. Smith, Sacramento, Cal.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

SILVER CITY MINES.—The latest intelligence from Silver City, Idaho, reports the mines to be looking remarkably well in that section. A great many new mines are being opened, and business of almost every branch is flourishing. Wells, Fargo & Co. shipped, per to-day's express to San Francisco, three bars of Red Jacket bullion, valued at $15,000, three bars of Minnesota bullion, value $9,135, and four bars of Golden Chariot, valne $7,540.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office, San Francisco:

BLODGETT ROAD SCRAPER MANUFACTURING CO., July 17.—Object: To manufacture and sell all sizes and atyles of patent road scrapers, known as the Blodgett Patent Dump Cart, for grading of every kind. Capital stock $200,000, in shares of $100 each, of which $110,000 have been subscribed. Directors: H. K. Moore, Jos. Curle, A. Gerberding, Wm. Holdredge and Chas. G. Yale.

BANDARETA G. & S. M. & M. Co., July 16.—Location: Mariposa. Capital stock $1,000,000, in shares of $50 each. Directors: John Whalen, D. W. Taylor, Robert Hannegan, M. Gately and J. W. Tripp.

AMERICAN NEVADA M. Co., July 16.—Location: Gold Hill Mining District. Trustees: Chas. E. McLane, B. F. Sherwood, Joseph Clark, A. M. Gilman and M. C. Hillyer. Capital stock, $4,800,000, in shares of $100 each.

PACIFIC NEEDLE MANUFACTURING Co.—July 21. Object: To manufacture all kinds of needles for sewing machines; also, to manufacture sewing machines and sewing machine fixtures and to purchase and sell materials for the same. Capital stock, $1,000,000, of which $50,000 has been subscribed. Trustees—Milton Andros, Benj. Smith, Jas. T. Boyd, H. G. Rollins and Geo. W. Chapman.

CRYSTAL SODA MANUFACTURING Co.—July 21. Object: To manufacture soda water and other mineral waters and syrups. Capital stock, $25,000. Trustees—Frederic Clay, Adolph Weske, John J. Meaburn; Ashly S. Taylor and Noah Moses.

Meetings and Elections.

BELMONT MINING COMPANY, July 11.—Directors: J. F. Boyd, (President,) M. J. McDonald, J. B. Haggin, J. W. Gashwiler, V. Fernbach. Secretary, O. H. Bogart; Superintendent, John F. Hacwell.

TECUMSEH GOLD, SILVER & COPPER M. Co., July 17.—Trustees: B. A. Becker, Ed. F. Ohm, George Lawlor James Assion and J. Greifs.

WASHINGTON & CREOLE M. Co., Ely District, July 15.—Directors: Geo. D. Roberts, (President,) M. S. Kelly, (Vice President,) T. Forde, A. J. Bowie, Thos. R. Hays. Secretary, Frank D. Oleary. Superintendent, Martin Tarpey.

DARDANELLES M. Co., Gold Hill, Nevada, July 19.—Directors: Jas. A. Pritchard, (President,) O. C. McCracken, (Vice President,) and James J. Robbins. Secretary, James L. King. The capital stock of this company has been increased two and a half shares for one, and parties holding the old stock are requested to change it for the new.

ECLIPSE, WINTERS & PLATO GOLD HILL CONS. M. Co., July 21.—Directors: H. H. Flagg, President; James H. Dobinson, Geo. W. Beavor; W. W. Stetson and Ed. F. Stone. Mr. Jos. Marks was retained as Secretary.

UNION CONS. M. Co., July 23.—Trustees: J. J. Hucks Geo. D. Roberts, S. W. Lee, M. J. McDonald, and F. M Freunde.

THE MINING AND SCIENTIFIC PRESS.—This miners' journal has entered upon its twenty-seventh (half-yearly) volume, and in every department and arrangement shows a decided advancement. In its particular sphere, or spheres, rather, the PRESS is unquestionably a very valuable paper to every branch of the mining interest from the Rocky Mountains to the Pacific Ocean. —[Inyo Independent, July 19, 1873.

Church and Steamboat Bells,
TAVERN AND BELLS, GONGS,
FIRE ENGINES, FORCE AND LIFT PUMPS.
Steam, Liquor, Soda, Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder and Copper Rivets, etc. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles. HYDRAULIC PIPES AND NOZZLES for mining purposes. Iron Steam Pipe furnished with Fittings, etc. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."
☞ Highest Market Price paid for OLD BELLS, COPPER and BRASS. 6-tf
W. T. GARRATT, JAMES HILLMAN, W. T. LITTLE.

N. W. SPAULDING,
Saw Smithing and Repairing
ESTABLISHMENT.
Noe. 17 and 19 Fremont Street, near Market.

MANUFACTURER OF
SPAULDING'S
Patent Tooth Circular Saws.
They have proved to be the most durable and economical Saws in the World.
Each Saw is Warrantsd in svery respect.
Particular attention paid to construction of
Portable & Stationary Saw Mills.
MILLS FURNISHED AT SHORT NOTICE
At the lowest Market Prices.

HALLIDIE'S
Patent Endless Wire Ropeway.
Covered by Numerous U. S. Patents.
IMPORTANT TO
Mining Companies, Civil Enginssrs, Contractors, Etc.
The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in conatruction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah, Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most chcerfully accept the work tor the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wegon roads, etc. Respectfully,
L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in the distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE
For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.
Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 113 and 115 Pine St.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 2, 1873.

VOLUME XXVII. Number 5.

Cheek.

The nnmber of individuals in this city and in the mining districts, fortnnate enough to be possessed of the title of M. E., is sometbing startling, and is increasing at a rate which is becoming really alarming.

We need many more mining engineers than we have. There is ever a demand for men of thorongh, practical ednoation and skill, to condnct onr mines. We wonld enconrage in every way snch men to come among ns. They are greatly needed and always warmly welcomed. Bnt we do protest most earnestly against the cool assurance with which every snrveyor or assayer, who so pleases, takes to bimself the mystic snffix, M. E., and, armed with this, misrepresents so cruelly a noblo profession.

The title of Mining Engineer is like those of M.D., Ph.B., A.B., LL.B., etc., in this respect: it is conferred hy a school of science, indicating that the stndent has pnrsued a fnll conrse in mining engineering, and has graduated therefrom in a creditable manner. No one is entitled to the name, who bas not fnlfilled the conditions. He may call himself assayer, snrveyor, expert, if he chooses so to do; bnt, legitimately, not mining engineer. In the medical profession the title is most jealonsly guarded, and any one who assnmes it wrongly is denounced as a quack. There are qnacks in the engineering profession as well. These shonld he exposed. The object of the title of M. D. is to protect onr health; that of M. E. should, in the same way, be in a measure a safeguard for the purse. The one wards off patent medicine qnacks; the other shonld defend from speculative qnacks.

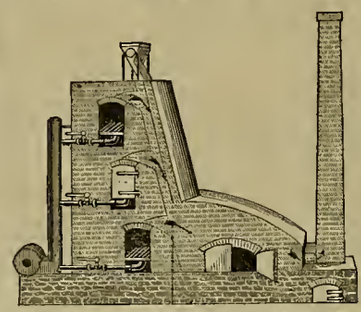
The truth is that there are in reality very few mining engineers at all. Only note how few gradnates there are, annnally, from onr mining schools. The most prominent of these are the School of Mines, Colnmbia College, New York; and the Rensselaer Polytechnic School, Troy, N. Y. There are also the Lawrence School, Harvard College; the Stevens Institute of Technology, Hoboken; the Sheffield School, Yale College; and a few others of less importance. The graduating class in each of these institntions is always very small—from Colnmbia, acknowledged to he the leading school, ont of a total membership of two hundred, only six, we believe, this year. Besides these American schools, those of Freibnrg and Breslan send us perhaps two in a year. From this it will be seen that, the demand heing in advance of the snpply, we are, as in other things, treated to a spurious article. We do not wish to he understood to imply that a man is any the less competent to take charge of a mine simply becanse his name happens to be wanting in two letters. But if he has the fitness, let his ability he its own herald, and he will not find his success (if deservedly won) impaired becaase he honestly refrains from poaching on what is not his own.

We have seen reports on mines from self-styled mining engineers that were perfect curiosities of illiteracy and pseudo-science, and which shonld, properly, have heen monnted in the cabinet hy the side of other distorted specimens forwarded at the same time. Ahounding in long and nsnally misapplied geological and mineralogical terms, they were constructed with the most snpreme indifference to rnles of grammar and common decency. They might, by their apparent scientific research, dazzle and mislead a few; but with most persons wonld only have the effect of hringing discredit upon a useful and highly cultivated class. It is a moral impossibility that any grsdnate of a reputable school, in this country or elsewbere, shonld fail in the rndimentary branches of edneation. The curriculum of a school of science bas much the same formative inflnence as has tbe nniversity conrse. The presence of bad spelling, inacenrate pnnctnation and garbled scientific phraseology in a report is in itself *prima facie* evidence that the writer is destitnte of thorongh scientific training.

Give ns a little more honesty, and a great deal less *cheek*.

The Eagle Chlorinizing Furnace.

We give this week a small cut showing a new form of furnace, recently patented throngh our Agency, by Thomas McGlew, of Anstin, Nevada. It is called the Eagle Chlorinizing Fnrnace, and is intended for roasting all ores to be snbjected to amalgamation. The claims of the inventor may be summed np as follows: cheapness in bnilding, cheapness in running, and simplicity of construction — the entire cost not exceeding $3,000. The fnrnace reqnires hut three men to run it twenty-four hours, one man on each shift of eight hours. The heat can easily be increased or dimiaished, as reqnired, to snit the different qualities of ore.



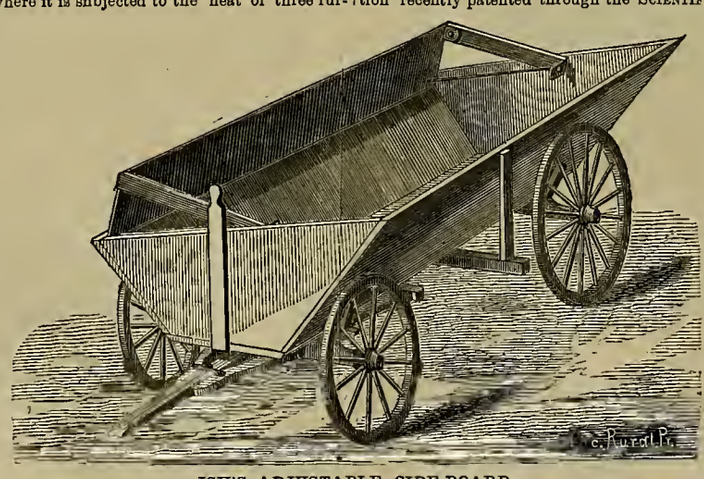
EAGLE CHLORINIZING FURNACE.

It will he seen, by referring to the engraving, that the ore, after leaving the feeder, or hopper, on top, falls down an inclined flue, where it is snbjected to the heat of three furnaces. It meets the flames issuing from the npper furnace, in the direction indicated hy the arrows, and then is snhjected to the heat of the two others in sncccssion, the heat heing angmented with the descent. The fines in size No. 1 are three feet long hy twelve inches deep. As the pulp passes down the incline or main flue (shown by lines on the exterior of the furnace) to fine No. 1, it there becomes heated and separated by the blast issning from that flue; thence to flue No. 2, where it is treated in the same manner, as also at fine No. 3. The incline, or main flue, is three feet wide, hy fifteen inches deep, to the main arch. After passing the three fines on its way it falls on to the receiving floor and there remsins with the three fires passing over it, and giving an opportunity for the chlorine fnmes to pass off with the smoke. The fines are five feet apart. The blower which makes this a hlsst fnrnace is shown on one side of the ont.

Size No. 1. has a capacity of eighteen tons. From the calculations made, the cost of roasting will not exceed $4 per ton, the present cost being double that, and varying with the locality. The inventor states that the cost of building is abont one fifth that of any other roasting furnace in the market. One of its principal features claimed hy the inventor is that it is the only furnace for chlorinizing ores where the heat can be regulated to snit all kinds of ores. It is stated that one of these furnaces will shortly be erected near Columbns Nev. for Mr. Bateman, one for G. W. Fish of Monitor District, and one will shortly he put up in Colorado for James Dawley. If tbis furnace rednces the cost of roasting ore as is expected, it will be a great boon to the mining community, and come into very general nse. Either Thomas McGlew or Clark E. Johnson of Anstin Nevada, will answer inqniries relating to the right to use the furnace, details of construction, etc.

Ish's Adjustable Side-Board.

The accompanying cnt represents an invention recently patented through the Scientific Press Patent Agency hy James T. Ish of Monticello, Napa county, California. By reference to the cut it will he seen that the side-board is secnred to iron hinges. The hinges are fastened to the center of each end of the box hy holts, upon which they work easily up and down. The side-hoard is holted to a small plate, which works on a loose rivet at the onter end of the main har of the hinge. The lower edge is secnred from sliding heyond the edge of the box hy a small rod, which works easily through a hole in the inner end of the main har. Pnll the lower edge of the board inward till it passes inside the edge of the box, and it slides down inside the wagon, entirely ont of the way of the spont, thns secnring it from danger of being broken or split. When the hox is fnll, and the loader ready to get ont, the driver takes hold of the hinge at the forward end, and the loader at the rear end of the wagon, and raise the board to its place. The straw resting on the side-board, which lies in a slanting position, inclines to pnsh the lower edge ontward to its position, as it is being raised up. The head on the small rod prevents the lower edge from being pnshed ontward beyond the edge of the hox. This enables the farmer to haul more straw at a load, without the least danger of its sliding off while passing to the stack or thresher, than it would be possible to haul without a side-board.



ISH'S ADJUSTABLE SIDE-BOARD.

Let alone hauling a bigger load, the amonnt of grain saved will more than repay the farmer for the expense of these side-hoards. It is nnnecessary to call attention to the loss of grain sliding off the lower side of the wagon; all who have been in the harvest field have seen this; bnt the adjnstable side-board prevents this, and none can feel the necessity of its nse more than the farmer with short crops.

Fools not all Dead Yet.

A short time since a man in the northern part of the State lighted a capped fuse in a cartridge of Giant Powder, which he held in his hand. His intention was to throw it into the river to kill fish; but, keeping it in his hand too long after the fuse was lighted, the fish escaped and the man was killed.

At the Hoosac Tunnel, a short time since, some fifty ponnds of Giant Powder were placed in a box, and on the powder was pnt a number of Electric Exploders, nsed for firing the powder with electricity. This box was pnt into the tender of the steam engine, a good supply of men packed aronnd it and the whole started into the tnnnel. As any sensible man might have expected, the sparks from the engine set the powder on fire, the fire set off the electric fnses, which in turn exploded the halance of the unburnt powder. The blaster left for Canada in the night to avoid arrest for placing powder and exploders in the same hox, amongst a lot of men, in a shower of sparks from a steam engine.

At Virginia City, a man of enterprise and ambition desires to get up a new explosive. He procures an assortment of "sample" explosives — innocent, harmless things, it wonld seem, in his estimation, or he would not have taken nitro-glycerine, gun-cotton, black powder, etc., to his sleeping-room, which was situated under a lodging-house filled with lodgers, and in the immediate vicinity of a bank, express-office, numerous large stores, etc. In the midst of these interesting articles he keeps a pet monkey. Under the circumstanoes, was an explosion anything unreasonahle?

The great saving in hlasting with these new, powerful explosives is forcing them rapidly into use all over the world. It is, therefore, of great importance, when there is an accident, that the pnhlic should nnderstand how it was produced and where the hlame should lie. In the above cases, it is evident the fanlt lies in the carelessness or imprudence of the men, and not with Giant Powder at all. The sensational report of an explosion at Catesville, Bedford County, Pa., proves to be false. No explosion has occurred there of any acconnt.

Vienna.—A dispatch from Vienna says that there is no donht that many of the higbest prizes for goods exhibited will be awarded to Americans. The Vienna correspondent of the *Tribune* says that the trial of mowers and reapers, which took place on the 9th instant, was a complete triumph for America.

The Guadalupe Quicksilver Mines are again in operation, under the same company and superintendency as formerly.

CORRESPONDENCE.

Notes of Travel in Eureka County, Nevada.—Concluded.

[By Our Traveling Correspondent.]

In the latter part of March, 1872, Geo. W. Kinney, then Mining Recorder of Enreks district, and M. G. Kavanangh found some rich silver ore on the northerly end of old New York Hill. They at once made several ledge and sqnare locations, and called the locality

Coy Hill.

There being no mille nearer than White Pine or Austin, miners and prospectors, for two or three years prior to thie time, were seaching for smelting oree only, and this section of the district hsd heen overlooked or forgotten; certain it is, thst for the period named no work had been done at this point.

The formation of the hill ie what is here called qnartzite and lime-qusrtz,—porphory would probably be nearer correct,—and is the noithern terminns of the quartzite rsnge extending sontherly to, and heyond Bald mountain, on which the splendid Hoosac mine is located.

The veins on Coy Hill are numerous, and have a general eest and west conrse, cutting the mountain at right angles through the quartz and porphyry. The Paul Jones mine liee between qnartz and decomposed porphory, and is a very clearly defined ledge, dipping to the south.

The Principal Mines

Are the Bob, Dick, Joe, Selden, Wild Rover and Paul Jones; the latter mine having produced as much fine ore to the hand ae any mine in Eaetern Nevada, without exception. Some twelve or fifteen other locstions were made by the eame parties. A controlling interest in all of the ahove locations is owned by Mr. Kinney, who has endeavored, during the past year, to develope them to the best of hie ability and meane.

The Ores

Are chlorides, horn and chloro-bromide of silver heing quite common, especially in the Bob and Paul Jones minee, and can and have heen worked by mill process without roasting. Virgin eilver, in fine psrticles, has also been found in the Selden and Boh mines.

Aeeaye running from $1,200 to $3,000 per ton have heen common. Over one huudred tons of ore have heen worked at mill snd furnace, aversging over $100 per ton; that from the Paul Jones being over $150, without any assorting.

The lowest depth on the Paul Jones is about one hnndred and twenty-five feet below the top of the hill, while ore ehows in a tunnel at ahout the eame dietance, etill lower.

On the south side of the hill is the Eureka Giant, a fine mine, belonging to Major W. W. McCay, who is developing his location ae rapidly as possible. The Winnemucca and Vermont Chieftsin are aleo fine looking prospects.

The minee on Coy Hill, located on the west eide of Eureka Valley, at the mouth of New York Cañon, are favorably eitusted for successful working and orea can be delivered at mill or furnace at emall coet. Seaton & Co.'e line of pipes, conveying water to Ruby Hill, cross the hill immediately above the Paul Jonee mine.

This dietrict is attrscting much attention, and cspital cannot fail to look at Coy Hill soon.

What is it?

Some, at present, unknown euhstance, mineral or chemical has been recently found in the Hoosac mine on Bsld Mountain. The suhetance is whitish, eemi-traneparent and reeembles frosted ice. On exposure to the air it is converted to a liqnid, something like kerosene; a burning seneation is imparted on tonching it to the tongue, and a gas ie evolved which inetantly takee five on touching it with a ooal of fire, as doee powder. A sample has heen forwarded to the Academy of Sciences for examination.

K. K Consolidated Mining Co.

A. S. F. incorporation; J. B. Haggin, Prest.; B. B. Minor, Sec.

Location of mine, on S. E. end of Ruby Hill, 2½, miles from Eureka, adjoining the Eureka Conecl. claims, the following mines constitute this incorporation: "Marcelona," "K. K.," "Surplus," "Loughborough," "Caron," "Endeavor," "Seek and ye shall find it" and one or two othere.

They have a fine 17-horse power engine, with safety cage, large ehaft house, with etore-room and hlacksmith shop attached—have a sheet iron powder house on the east side of the ravine, two ore dumpe for the 1st aud 2nd class ores, connected with the ahaft house hy means of oar way and ore ehutes.

Main shaft is 200 feet in perpendicular depth; has two main galleries driven in or near the hanging country rock, with car track throughout. Vein from 20 to 50 feet thick; working 60 men per day; raiee 50 to 60 tous of ore averaging (grose,) $50 to $60 per ton; recently struck a new ore body at the bottom of ehaft, particularly rich in lead, gold and silver; Clark's water worke enpply water in main building. Hae alresdy shipped eomewhat less than 1,000 tons of lead hullion.

For the laet two months hae been selling all the ore raised, on the dump, to the Ruhy Consol. M. Co. (Lim.) An English Co. contract will he finished preeent month.

K. K. Co. has in anticipation rented the large furnace of the Silver West Co., and are now hard at work getting it in order to run; expect also to he able to continne supplying Ruhy Consolidated.

K. K. psid its first dividend of $12,500, or 25c. per share (total shares 50,000) laet month —will pay again the present month and everything is favorahle for a continuance. There are many thousand tons of first-class ore in eight —the proepectings are kept well ahead so that there is no fear of running short for meny months to come. W. S. Keyee, formerly Supt. of the Eureke Consol., is the msnager.

The Ruby Con, M. Co., (Limited.)

Of London, England; H. Heynemann, Gensrsl Agent at San Francisco; O. H. Hahn, Superintendent.

The cornoration owns 5 mines in different parte of thie district.

The Bullwhacker mine, about 2⅛ miles north of town, located in the foot-hills, hss yielded a large amount of lead ore, assaying $35 in eilver and from 30 to 60 per cent. in lead. The explorathone consist of two shafts of respectively 240 and 130 ft. in depth, and numeroue levele and cross-cuts.

The Dunderherg mine, 2½ miles south of town, on a spnr of Prospect monntain, is a fine N and S etrata-vein, and has also yielded a large amount of lead-ore of a very good grade. Ite average assay value is about $50 silver and $10 gold, and its contents in lead varies hetween 20 and 30 per cent. Hoisting-works have been erected recently, which will be started soon, to open up the mine properly.

The Lord Byron and Valentine mines on another epur of Prospect mountaiu yield only small quantitiee of high-grade silver-ore at present, owing to their undeveloped state.

The same may be eaid of the El Dorsdo mine, which ie located on Proepect Mt., proper. This mine has yielded about 200 tons of ore, averaging $230 in gold and silver, and 15 per cent. lead.

Smelting Works.

The smelting worke of this company are situated in the eouthern psrt of town. and comprise two blast-furnaces of a capacity of 40 tons of ore per day, each; one 35 horse power steam engine, with two boilers; two of Root's blowers, No. 4; one of Cameron's steam pumps, No. 3; one Brodic crusher; eubstantial ore and coal hins; office-building, etore-houses, etc.

Theee works do a large amount of custom work, as the present supply of ore from the company's own mines is inadequate to their capacity. Both furnaces produce from 7 to 12 tone of lead bullion per day, assayiug on an average $56 in gold snd $193 in silver, making a total of $249 per ton.

Pritchard's Fast Freight Line.

This freight line carries wares over an extent of country 300 miles in length, from Palissde to Pioche, via Eureka and Hamilton; and hrings into requisition 28 eight-mule tesms, 15 eighteen-mule teams, and occssionally run a twenty-four-mule team ueing six wagons, making a team with wagone 300 feet in length; a novel eight to look upon.

This line runs on three kinds of time, making the distance from Palissde to Pioche in five daye, fast time; in eight daye, medium time; and in fifteen days, slow time. Five cents per pound ie the charge for freight on fsst time to Pioche from Palisade, and four cente for elow time. R. Carter is agent at Palisade; George Coules, at Eureka; J. Sherburne, at Hamilton; and T. F. Lawler, at Pioche.

Lumber.

The amount of lumber consumed in this district annually, ontside of mines, and for bnilding only, will exceed 1,500,000 feet. There are three firme in the business, and the price of this article ie from $90 to $120 per thousand.

Some 18 milca north of Eureka, a new district hae been opened up, and known as

Diamond District.

It is eituated on the road leading to Elko, from Eureka, and ie creating eome etir in Eastern Nevada. I ohtained the following particulars about one of the principal mines of that district, known ae the

Champion Con. M. & L. Co.,

The principal office of which is at 332 Montgomery street, San Francisco. William Paul ie President, H. C. Howard, Secretary, and E. P. Elzy, Superintendeut. This corporation hae one shaft down upon the mine 170 feet in depth, and at a depth of 100 feet levels are ruu hoth north and south in good ore, and show an average thickness of five feet, running from three to eeven feet thick. A tunnel now in course of conetruction, to connect with the hottom of this shaft, will probahly he completed before thie appears in print. The ore of thie mine ie galena (or smelting ore.) They have ahout 600 tons upon their dump, that they estimate will go from $100 to $250 per ton; they have also in course of coustruction, a fine smelting furuace, that is to smelt 45 to 50 tons per day. From White Pine in my next.

L. P. MC.

Gravel Mines.

EDITORS PREEE: Seeing that you have broached the gravel question by an article in your issue of July 5th, and one in that of July 26th, and feeling as you do, that it is a very important one to Cslifornis, I am induced to contribute my mite towards caneing a general agitation of this matter.

In 1856, I think it was, the yield of gold dust in California reached ite maximum. Since then a graduel falling off hae reduced the annuel product to ahout one-fifth, (excluding gold quartz.) When the shallow diggings began to fail, it was thought hy many thst the placer mines were heing rapidly exhausted, and that feeling still prevails to some extent; but a careful eurvey of the queetion will prove its fallacy.

A New Era

Hee already dswned on placer mining in this State. Instead of eeeking in the ravines, small streams and gulches for the shsllow depoeits as of yore, the miner now prospecte for the precious treasure on the low hills and elevated ridgee; and when fonnd, it is in more extensive deposits and deeper heds. By the receut improvements in hydraulic mining, he is enabled to realize large profite from whst then was conaidered worthless ground. Wherever an ample eupply of water can be obtained and brought to bear with eufficient pressure, ground containing only a few cents per ton paye well. But the miner need not content himself with this poor ground, for there are still to be found deposits as rich, and in much greater quantities then heve ever yet been diecovered; for the ehallow placers of former times were merely washings or out-pute from the main sources that exist in the lesds or ancient river heds which are now being opened as deep gravel mines.

Opinions are various as to the origin or

Formation of these Deposits.

Some contend that they were formed hy glacial action, othere that the surf of the eea which once covered the whole country formed these gravel beds. But the most populsr, and I think the most reaeonahle one, ie that they are the channels of dead rivers. There csn be no doubt that in many of them, at leaet—if not all—unmistakable evidences are found to estshlish thie theory. Take, for example, the Table Mountain of Tuolumne county. Here is a water worn channel for forty miles or more meandering through the foot-hills of the Sierrae from north-eaet to south-west, filled with smooth boulders, pehbles and river sand, and bordered on either side by "rim rocks." This old channel has been cut in numerons places by the modern streams that crose it, and hy the miners who have driven tunnels, suuk shafts and run drifts and has in every case shown the eame characteristics. Thie stream, like sll othere of its clase is cspped with lava and volcanic aeh. It eeems that at some period of the paet these water sourcee were filled to the brim with molten lava which after cooling hecame harder than the surrounding couutry rock and now remaius intact, while the country has worn away leaving these mountains or ridges of bassIt many hundred feet in elevation, forming a flat tsble land their entire course save where they are cut by the streams; hence the uame Tsble Monntain. In Butte county is a eimilar formation terminsting at Oroville. The Feather river has cut its way through it at Cherokee flat, exposing its deep gravel bede at thie point, and for years has been a eource of great profit to the ownere of claims in that locslity. This stream hse aleo been tapped in many plscee hy the enterpriciug miner, and has proved of the same formation and character, establishing beyond a douht not only the fact of their once having heen flowing rivers, hut that they are storehouees of immense wealth, which are soon to be unlocked to the world.

Some of these Ancient River Deposits,

Althongh at one time capped with the nniversal lavs, have either worn away with the country rock or softened sufficiently to yield to the hydraulic pipe. At all events the denudation has kept psce with the eurrounding country, and they are now merely ridgee or dividee in which the moet valnable hydraulic minee are eituated. Almost every mining county poesesses one or more of these gravel rangee. I have examined a great many and am forced to conclude that they all mark the conree of ancient rivere. The ueual direction of these streams ie northerly and southerly, but in some localities east and west courses are met with, bnt this system seems to he of a more modern formation. In Eldorado county, for example, the hed of the blue gravel lead running from north to south is several hundred feet helow thoee running from east to weet, which eeems to take its riee in the Sierra Nevadae near the head of Wehher Creek, paeeing down the divide between the north fork of the Cosmos river and Wehher Creek, some forty miles, and after spreading out over the lower foot-hille around Latrobe and Folsom, looses itself in the Sacramento valley. Thie ie considered one of the richest and most extensive gravel deposits in the State, and when sufficient water ie obtained will be as productive as any.

The ridge lyiug hetween the Middle and South Yuha, in Nevada county, is another depoeit of a similar character, heing eome thirty miles from east to west and several milee in width. Professor Silliman estimates the probahle yield in gold in this section at $534,610,000, not takiug into account the gravel which underlies the volcanic formation. But prohably the

Great Blue Gravel Lead

Is the grandest gold deposit in the world. It hae been cleerly defined for more than 100 miles in length. From the upper end of Plumas county, far north of Qninoy, to south of Placerville in El Dorado county, it hae heen opened in numerons places. At the foot of Pilot Peak, Sierra county, the celebrated North America mine has been worked for many years; it is now owned and operated by an Englieh company. The Pilot Consolidated, adjoining, is just heing opened and promieee to rival the North America in its yield of gold duet. From this point this great lead seems to divide, one channel, trending more southerly, crosses Slste Creek above Gibeonville, and has heen opened at Howland's Flat, St. Louis, Morrietown, Craigs, Eureka North and st Poverty Hill, where it unites again with the northern branch which passes under Whiekey Digginge, Gibeonville, Laport, Secret and Burn's Diggings to Poverty Hill. Here at the junction is known to exist msny hundred scree of very rich gravel from 40 to 200 feet deep. Some of the claims have heen in euccessful operation for several years and others are being prepared for work at great expense and within a few months will he completed. A consolidation of the whole hill is about to he effected, when it will be worked under one management, forming one of the most valuable properties in the State. Scale's Diggings comes next going south. The Boyce Brothers own the Fairplsy mine, two miles further south, and have the most complete hydraulic worke I have ever seen. This mine has yielded large dividende for several years and but a small portion of the ground has heen removed.

Brandy City, Camptonville snd Smartsville, are prominent pointe on this great gravel rsnge. The latter place is in Yuba county and is widely known to posseee more exteneive operations than any other section of like extent in the State. Among the most prominent mines locsted here may he mentioned, Pactolas, Blue Gravel, Blue Point, Babb and Smsrtsville, all of which are being worked by the most approved hydraulic procese and are paying enormous profits to the owners. The grsvel deposit varies from 125 to 200 feet in depth and is worked throngh bed-rock tunnels in which the "tail" flumes are laid. These flumes or boxes are from 6,000 to 15,000 feet in length costing lsrge sums of money and years of labor to complete. The gravel in many places is compactland hard, requiring the action of powder to break it up for the pipe, often a charge of 700 kegs being exploded at a eingle hlsst. Ample water ie at hand, and pay ground for a generation, North San Juan, Sweetland, Red Dog, You Bet, Little York, Nevada, Iowa Hill, Wisconsin Hill, Michigan Bluff, Forest Hill and on through El Dorado county, southward. Millione of dollars were eet loose by the cutting of the modern streame and numeroue hy-waehes along its course which, have heen gathered hy the miners of former yeare. Other millions have been extracted from its deep gravel beds along ite great leugth and yet it has not given up a tithe of its treesures; theee glitteriug heape still awsit the capitsl and energy of man to enrich the world.

Poesessing all these

Vast Resources,

Then, as California does, who dare ssy the gold placere are exheusted? I feel justified in eaying that the next decade will realize far more from thie source than has been done by the paet two. Gold mining is hut in its infancy: every eucceeding year will witnesa new fields opened; improved implements will come ino use; means will he adopted to save the lsrge percentage that is now lost through the tailings, and mining enterprieee will ceaee to be looked upon as a epeculative venture, but sdopted ae a eafe and reliable pureuit.

San Frsncisco, July 28th. J. P. C.

IRON ORE.—The Santa Cruz *Sentinel* saye: On the coast cliffe north of Laguna Creek, msy be eeen large hodies of magnetic iron ore, cropping out amid shale and ohalk rock, ae if blistered hy the hot eun. We have never eeen better indications of a good iron mine than in that vicinity, especislly ineide the creek baein on the northern bluff. There are aleo beds of bog ore in the hasin, as indicated by the ochre-yellow or dense red-iron rust ecum which oozes np through the boggy eoil. We noted several of these epringe. The whole coaet along, above and helow Pebbly Beach, ie veined with rich iron ores. At the Yellow Bank dairy the eulphurets of iron have diecolored the rocks and clay—hence the name. We believe that there is iron enough in the San Vicente Ranch to huild all the railroads required in the State, if worked up into rails, tiee, froge and epikes. It is certainly worth eome proepector's time, who ie competent to judge, to mine out some of the ore and have it assayed.

Another curioue feature of the land in that eection is the brilliant pebhlee—corueliane, rubies, garnets, etc.,—which ahonnd among other hright gravel stones on the heach. These pebbles are in a layer 18 inches thick and about two feet helow the surface of the eoil all along the plateau immediately above the beach. The encroachment of the eea and water floods from the hills wash them down into the eurf, where they are triturated and polished into modern hrilliants, much sought after by coaet scavengers who pick them up hy hushels and carry them away to work into jewelry, adorn vases and flower pots, or ornament garden walks. Some of the pebbles are very beautiful and of considerahle value.

SCIENTIFIC PROGRESS.

The Constitution of the Sun.

M. Faye has recently, at tha request of the editor of *Les Mondes*, furnished the readers of that jonrnal with a very interesting summary of his ideas as to the physical and mechanical constitution of the sun. The following is an abstract of his paper:—

The sun is perfectly spherical, and turns in less than a month about an axis with invariable direction. Its mean density is superior to that of water, but its surface phenomena show that it is at least gaseous in its extreme layers. And as, by means of heat, liquids subjected to very strong pressure may be entirely changed into vapor without altering in volume, it is very possible that the greater part, if not the whole, of the solar mass is, notwithstanding its density, in a state of gaseous fluidity. Where does this fluidity terminate? Is there a solid or liquid nucleus? This question is an insoluble one.

The spherical form and the rotation, regular in some respects, give the idea of a mass which has reached a certain stability. To discover the condition of its internal movements, one way only is open to us: the study of the rotation. If the sun turns like other bodies, so that the angular velocity is the same in all parallels, the internal movements should be reducible to a very gradual contraction—general and equal in all directions. Now, on the contrary, this study has led to the remarkable result, that the angular velocity of the superficial rotation, instead of being constant, decreases rapidly from the equator to the poles in a continuous manner, so that, at the latitude 39°, a point on the surface takes two days more than one at the equator to make a complete rotation. Moreover, this phenomenon is not accompanied by any movement of translation, any current from the equator to the poles, or from the poles to the equator; it is, then, impossible to attribute this surprising rotation to any superficial cause like that of our trade winds.

Such a rotation requires that the interior movements are reduced to simple vertical ascending and decending currents. Thus are explained the formation and maintenance of the atmosphere. The law of rotation which has been established, and from which it appears that successive streams of the photosphere in the direction of parallels, have not the same angular velocity, leads us to an important consequence. Such variations of velocity cannot exist between contiguous streams without giving rise to eddying movements ressmbling those in our waterconrses, and in our atmosphere from similar causes.

In currents of water, such phenomena are in general little developed, and of short duration. It is otherwise, however, in the atmosphere, where the eddying movements are met with in a great variety of forms, from the simple whirlwind, and waterspout, and tornadoes and cyclones. All these phenomena are essentially alike. They have the form of the trunk of an inverted circular cone with vertical axis; the whirling movement, slow at the surface, being immensely accelerated towards the interior or lower portion of the cone. If they meet any obstacle they divide into partial whirlwinds; ere long these disappear, having lasted for days or entire weeks, and had surprising mechanical effect.

Such a phenomenon is independent of the temperature of the gaseous mass in which it is produced. It may, then, be produced in the sun, and on a grander scale, for the gaseous masses there, are so to say, unbounded, while the whirling movements in our thin atmosphere are hindered by the obstacles of continents and oceans.

From the physical point of view, our cyclones produce singular effects, which are due to the aspirations, excited by violent gyratory movements, upon superior layers, in the direction of the axis. The cold air of the upper regions in which their orifice opens, is brought down, and produces at the lower part a sensible fall of temperature all round. It reaches the lower layers, through the cyclone, with a strong electric tension. It condenses the vapours of the more humid air, and produces storm clouds. Every cyclone is thus enveloped by clouds incessantly renewed, and travels over the earth's surface, throwing down rain or hail, leaving behind a state of coolness.

Viewed from above, from a point at some distance from our globe, the ordinary waterspouts would scarcely appear, except at single points; but the cyclones, whose diameter is sometimes hundreds of leagues, would have the effect of circular cloudy spots in the form of funnels, variously lit by the sun, and moving slowly over the earth. One might see them going in groups, or divided snddenly as they met some invisible obstacle, and forming two or several partial cyclones, which would separate from each other, following routes slightly different.

Evidently the special rotation observed in the sun should produce whirling phenomena similar, except for the purely physical circumstances dependent on temperature. It would have been natural, then, to study the photosphere from this point of view, and we should not have failed to perceive in the spots the equivalent of our cyclones.

This has not, however, been the mode of procedure. It has been necessary to examine, one by one, all the characters of spots, to study the laws of their movements and their mode of segmentation; to discover, in fine, the roseate layers of hydrogen, with its incessant eruptions, which envelopes the sun, before being able to establish an assimilation which might be anticipated *a priori*.

In fact, the spots are round, having the form of a funnel greatly widened at the upper part; their axis is very nearly vertical; their interior, filled with materials similar to those of the chromosphere (a roseate layer, formed in great part of hydrogen, which rests on the photosphere), reveals to the spectroscope, by phenomena of absorption, a notable lowering of temperature; in a word, the analogy with our cyclones, is complete from the chemical and physical point of view. Nor is it less striking from the mechanical.

The spots follow vigorously the current of the photosphere, exactly as our cyclones follow the greater currents of our atmosphere; and, what is still more curious, the spots in which one can perceive a movement of internal gyration turn absolutely like our cyclones. The latter turn in a direction opposite to the hands of a watch in our hemisphere, while, in the southern atmosphere, they turn in the direction of the hands. It is precisely the same in the sun. The phenomenon of segmentation of our atmospheric cyclones has also its distinct counterpart in the sun.

One of the most beautiful phenomena in nature, is the circulation of solar hydrogen. It is known that the chromosphere is incessantly furrowed by jets of hydrogen mixed with incandescent vapours, in which spectral analysis reveals the presence of certain metals, such as sodium, iron, magnesium, &c. These jets rise, sometimes with astonishing rapidity, to heights of ten, twenty and thirty thousand leagues, and fall back again slowly to the chromosphere. Now, these eruptions proceed assuredly not from the spots, the mechanical action of which is precisely the reverse, but from faculæ with which the spots are generally bordered. It is not said that the incandescent jets of the chromosphere belong exclusively to the faculæ; the whole surface is rough with small ascending flames; but it is to faculæ that the greatest protuberances and most violent eruptions correspond.

The hydrogen, more or less mixed with metallic vapours, is thus incessantly thrown above the chromosphere in enormous masses, in such a manner that the eruptions might double, triple, &c., the roseate layer which environs the sun, so great is their intensity and their frequency. The chromosphere retains a constant thickness of from 5,000 to 6,000 miles.

There is, between these phenomena, viz., the spots, the faculæ, and the hydrogenous eruptions, a connection easily understood.

We have seen that the solar cyclones must exert on the hydrogenous layer (relatively cold), which surmounts the photosphere, a down-drawing force, so that the hydrogen of the chromosphere is sucked into the deeper layers, the high temperature of which it soon takes. But this gas, in consequence of its specific lightness, cannot remain in these much more dense layers; it remounts to the surface, quite outside of the cyclone, immediately on its ceasing to be affected by the gyratory movements, and, under the powerful action of solar gravity, it leaps through the roseate layer, after having slightly raised in its passage the luminous clouds of the photosphere. It carries with it much heavier metallic vapors, which leave it at a certain height, and throws them on the chromosphere, where they show their presence by bright lines corresponding to the metals. The case, then, is not that of a continual eruption of hydrogen produced from the depths of the solar mass, and pouring continually into the roseate layer (which would then increase to the view); but it is a simple circulation of the exterior hydrogen, which, under the action of the solar cyclones, penetrates into the superficial layers, to return immediately to the surface.

If the solar surface is all over roughened with jets of this kind, and in parts where spots never appear, this is because the cyclonic activity of the sun is not limited to the spots alone. It appears in those small dark holes or pores which are found over the entire surface, and the real dimensions of which are by no means insignificant (300 to 500 miles). In certain regions comprised between the two parallels of 45° latitude, these small pores gradually enlarge more and more; they are then seen to become veritable spots—in a way similar to the growth of some of our cyclones. But at and near the two poles, the superficial movements of the photosphere do not favor this enlargement. The whirling movement there is undoubtedly troubled and variable, as it also is in a narrow zone situated at the equator.

Our cyclones always present the same peculiarities. The only essential difference lies in the fact that the solar cyclones remain in the regions where they are formed, and have hardly any movements of translation but those of currents parallel to the equator.

The following statement recapitulates the principal points in my theory:

1. A nebulous or chaotic fluid mass formed of gas and of mixed vapors, raised to a very high temperature, animated with a movement of rotation, and cooling by way of superficial radiation into space.

2. Formation of a photosphere through condensation of the vapors of the external layer, and, at the same time, separation of the chromosphere, formed of hydrogen relatively cold, but at a temperature superior to the point of dissociation of nearly all its compounds.

3. Maintenance of this dazzling photosphere by the play of vertical descending and ascending currents at all points of the surface.

4. Special modifications introduced into the rotation by the continual play of the vertical ascending currents.

5. Whirling phenomena (pores and spots), produced over all the surface by this special mode of rotation; the spots or cyclones being concentrated between the parallels of 40° north and south.

6. Circulation of solar hydrogen due to the action of these whirling movements in the red layer.

MECHANICAL PROGRESS.

Origin of Wire Ropes.

The invention of wire rope is to be credited to the late Mr. George Wright Binks, who, in the year 1830, was foreman ropemaker in the Woolwich Dockyard, England. During the English complications with Russia, a failure of the hemp crops, operated so seriously upon the price, that the Admiralty was paying 80*l.* per ton for hemp. The thought struck Mr. Binks of twisting together fine iron wires to form a rope, and he made a specimen—still preserved—which he submitted to the Admiralty officials, who, however, did not approve the idea. Captain George Harris, of the Royal Navy, alone thought that there was in this specimen the germ of a great and important manufacture, and taking Mr. Binks by the hand, established a manufactory on a small scale, at Grimsby, in the year 1835. Retiring with a good name on well-earned laurels, Mr. Binks was able to hand over to his sons the nucleus of the largest business in this line in the world, and the parent of all other similar manufactories.

Wire ropes were first conceived and used for the standing rigging of ships. The first vessel rigged with wire rope as an experiment was the "Marshall," of Great Grimsby. But now the uses of wire ropes are innumerable. Amongst the most prominent are—ships' standing and running rigging; submarine telegraph cables; suspension bridges; guide, incline and flat ropes for mining purposes; special forms of rope for engineering purposes; pneumatic telegraphs; traction ropes for tramways; steel plow ropes; coulippe ropes for transport of sugar canes, etc.; tent stay ropes; ropes for hoisting purposes; tow ropes; endless driving bands; bullock traces; telegraph running and stay strand; fencing strand; scaffold ropes; railway signal cords; clock lines; clothes lines; sash lines; lightning conductors; gilt and silvered cords for hanging pictures; and many other applications might be enumerated, whilst for all these purposes they are stronger, lighter, cheaper and more durable than any other article. They are made from cast, homogeneous, and Bessemer steel, from charcoal and common brands of iron, bright or annealed, and from copper and brass. They are made in a multitude of varied forms, with from one to very many strands, with hempen cords or without, or with covered wire, and in gauges of wire from those as fine as a hair to those of the thickness of one's finger. When we estimate that there are at least over thirty wire rope manufactories in existence, large and small, employing a very large number of hands, the importance of the trade will at once be recognized. It is evident that many important steps in modern progress, such as submarine cables, suspension bridges, etc., could not have been effected without the aid of this principle, whilst thousands of pounds and thousands of lives have been saved by the adaptability of wire ropes to shipping and mining purposes.—*Iron Age*.

Steel Boilers for Steamboats.—The steamboat Mary Powell, running daily on the North river, between New York and Rondout, has recently been fitted with steel boilers. We append the dimensions and weights, which may be interesting to our readers. There are two boilers, of the form known as flue and return tubular. Each boiler has 10 flues of different diameters, 9, 15, and 16 inches, and 80 tubes of 4¼ inches outside diameter. Each boiler is 11 feet front, 25 feet long, and the diameter of shell is 10 feet. The sheets of the boiler are of steel, having a tensile strength of 70,000 pounds per square inch. The sheets are 5-16 of an inch thick. The boilers weigh 28 tons each, the weight of the two being 7 tons less than that of the old iron boilers.

Artificial Magnets.—M. Jamin recently constructed a magnet, weighing four pounds, which carried 22 times its own weight, or 88 pounds. The usual carrying capacity of an artificial magnet is three or four times its own weight, although there have been isolated instances in which a much greater power has been obtained. In the construction, M. Jamin followed to its limit the plan of employing a number of plates—that usually adopted when a strong magnet is desired. The only variation in this case was the employment of much thinner plates than those usually made use of. Each plate was very thoroughly magnetised.

Best Preventive for Slipping Belts.

One of the most prolific sources of loss of power in transmitting from motor to work, is found in the slipping of belts. Careful experiments prove that in the best working, a pulley which makes 100 revolutions per minute, loses two full revolutions, or two per cent. The *Scientific American* appears to think that eight per cent. is oftener lost. This for a 200 horse-power means 16 horse-power thrown away in this manner alone.

Various devices are resorted to, to prevent or reduce such loss—such as covering the periphery of the wheel with resin or other adhesive matter, tightening the belt, and thereby bringing increased bearing and wear upon the journals, etc.; but probably the best plan yet devised is to stretch around and cement, or otherwise secure to the periphery of the same a flat band of elastic rubber and cloth, with its inside face not vulcanised.

Experiments have recently been made in New York, to thoroughly test the value of this device, and with most satisfactory results. The journal above named describes one as follows:

The tests made in our presence were conducted on a special apparatus, consisting of two 12-inch pulleys on a shaft in bearings, so that it could freely revolve. Upon one wheel the inventor had placed his cover; the other had a plain smooth face. Over the plain wheel was passed a four-inch belt, one end of which was secured to the floor; to the other extremity (the slack side of the band) were hung adjustable weights. Upon the covered pulley a two-inch belt was placed, which also carried a weight at one end, but at the other was attached to a hand lever. On suspending 29 pounds to the small band, and some 60 pounds to the large one, it was found, on applying a pressure to the lever, that the smooth wheel was caused to slip with great readiness. Without augmenting the weight on the small band, that bearing upon the smooth wheel was increased to 108 pounds, in spite of which the latter was easily and by the same means made to slip. Above this limit, however, the power of the covered wheel did not extend, and on the addition of more weight it also began to yield.

The result may therefore be summed up in the fact that friction of 29 pounds opposing the pressure of a hand lever on a two-inch belt, aided by the pulley cover, was sufficient to overcome the friction of 108 pounds, acting on a four-inch belt, opposing a solid support, but applied to a smooth though otherwise similar pulley.

A second test was made with a smaller apparatus, having an eight-inch pulley and a one-inch belt. The result was gained by the aid of a lever and steel yard suitably arranged. With the pulley smooth, the scale marked 3½ pounds, when the belt slipped freely. When, however, the cover was applied to the surface of the same wheel, the pointer indicated 19 pounds, or some five times the resistance. It would seem from the above that the claim from the inventor, that his device will transmit 100 per cent. more power than the smooth pulley, and consequently do twice the work before the belt will slip, is well founded, as such estimates are manifestly much below those obtained by actual trial.

So simple and effective an invention as this, is worthy of the attention of machinists generally. The expense is inconsiderable in comparison with the economy which its employment must produce.

Testing Machines.—The testing of metals to ascertain their quality before converting into manufactured articles is occupying the attention of the community interested in such matters to an extended degree. The *Iron Age* says a new machine of ingenious, but simple, device is now being made by a well-known firm in Philadelphia, the Messrs. Reihle Bros., which is a compact, powerful weighing machine, so adjusted as to ascertain with the utmost accuracy the strain required to break the test piece of iron, boiler plate, column, girder, bridge bolt, chain, wire rope, etc. The machine is as nicely balanced as any ordinary scale, having steel fulcrums at every friction point. The balance is so delicate that an ounce weight placed on the weight-holder throws it out of equipoise. It has already attracted the attention of the largest operators. One of 82,000 pounds capacity was shipped to Cincinnati lately, and subsequently a number of the most satisfactory experiments have also been made at the Baldwin Locomotive Works, with boiler plate particularly. A tool for holding the plate, so that it is subjected to a fair and square strain, is of novel device, and accompanies the machine. This firm has turned their attention to this branch of business, and are making preparations to engage largely in it. The remarkable nicety with which tests can be made with their machine will make experiments in testing material very interesting and useful.

New Method for Boot and Shoe Heels.—John Blakey, of Leeds, England, has lately patented in this country a method or process of forming heels or heel-lifts for boots and shoes, by first cutting, from waste scraps of leather, small pieces of appropriate size and shape; next, compacting and solidifying such pieces into a solid bar, with or without a wooden core, by means of adhesive material and pressure; next, drying the same, and then cutting or sawing the same into heel lifts of the desired thickness.

Our Weekly Stock Review.

THURSDAY EVE., July 31, 1873.

The same chronic dullness which prevailed in Stock Circles last week has continued during the present one. No new features have been developed nor have any new bodies of ore. Prices have been weak and sales few. The dullness which is felt in nearly all departments of business in the city is felt in the Stock Market and there are no particular signs of an improvement. Reports from the different districts are about the same as usual, but nothing new of importance is announced from any of the prominent mines. However, faith in the mines is not as great as it was a short time since, as most people gauge their opinions by the state of the Stock Market more than anything else. Therefore when stocks are down mining property is worthless. The "excitement" mentioned in another column may serve to revive interest in mining matters until something turns up in the Comstock. The Ploche mines seem to be looking up a little as will be seen in the reference made to them in another column.

The fluctuations in prices during the week have showed little variation, and what have occurred are of a discouraging nature. If the New Salt Lake Stock and Exchange Board does not have more business to do and better encouragement than the San Francisco Board at present, it might just as well wave waited a little longer before beginning work.

For Mining Shareholders' Directory see page 76.

Mining Summary.

THE following is mostly condensed from journals published in the interior, in proximity to the mines mentioned:

California.

AMADOR COUNTY.

OUR MINES.—Amador *Ledger*, July 26: As far as we can learn, our quartz mines are looking as favorable as at any former period, and the gold yield satisfactory. In placer mines but very little activity prevails except in the vicinities of Volcano and Aqueduct City. The Amador Canal in that section of country, is furnishing water to all who require it on accommodating terms, and will be able to do so through summer. There is a large scope of country within reach of the waters of the above canal that ought to be developed, and for that purpose miners should avail themselves of the present supply to unlock the golden treasures hidden away beneath the hills and flats of that section of our mines.

CALAVERAS COUNTY.

CLEANING UP.—Calaveras *Chronicle*, July 26: Messrs. Simpson, Veith & Shear, proprietors of the mammoth hydraulic in Tunnel ridge, are making a general clean-up in anticipation of the water famine that is imminent. They continue washing, however, as much of the time as possible, and from the known richness of the mine we look for a yield well up among the thousands. The company let a contract for running a tunnel in which to place their sluices, which, when completed, will give them a much better "dump" than they now have. Owing to the scarcity and probable failure of water for hydraulic purposes, however, work in the tunnel has been suspended for the present.

WORTH'S HILL HYDRAULIC CLAIM.—Work is steadily progressing in the Worth's Hill hydraulic claim. A large amount of water, with a heavy pressure, is used, and as the claim has an excellent dump, the gravel is washed very rapidly. No general clean-up has been made since the claim was opened, but the satisfactory manner in which the riffles of a few of the first sluices "pan out" well is all the evidence the owners want that the claim is paying well.

MOSER & HOWARTH, proprietors of the great Spring Gulch gravel mine, continue to push operations with energy, and we are glad to be able to say that their exertions are handsomely rewarded. Notwithstanding the decrease of the supply of water in the ditch, the facilities afforded them by their large reservoir enable them to continue work uninterruptedly. The yield from the claim is large, ranking it among the remunerative mines in the county.

CLEAN-UP.—We are unable to give the exact figures in regard to the amount obtained in the recent clean-up at Garland's mill, Mosquito Gulch, but learn that the yield was satisfactory. The rock crushed was taken from the noted Good Hope mine, belonging to the parties who own the mill. We understand that the main shaft on the mine is to be sunk 100 feet deeper, and that the work will be commenced immediately. The Good Hope is supplied with first-class hoisting works, and the prospects are favorable that it will develope into a valuable mine.

THE CHILI GULCH HYDRAULIC.—Duryea, proprietor of the Chili Gulch Hydraulic, continues his inroads upon Stockton ridge with unabated vigor, and we are glad to learn that the "bank" honors his drafts upon it in sume to suit. The derrick recently put up in the mine is capable of removing the masses of cemant and lava as fast as the hydraulic uncovers them—a circumstance that greatly facilitates the rapid working of the mine. We understand that Mr. Duryea is preparing to clean-up in consequence of the fact that the decreasing water supply may necessitate a suspension of operations during the remainder of tha dry season. While the laying-over of the various hydraulic mines in this vicinity would affect the interests of the whole community unfavorably, such a result is probably unavoidable.

GWIN MINE.—We are glad to learn that good rock has been struck in the 700-ft. level in the Gwin mine. We understand that the ledge is coming in handsomely—looking even better than in the 600-ft. level. The development of a paying ledge at that depth is a sufficient guarantee of the permanency of the mine.

We take the following item of interest from the *Mountaineer* of Wednesday last:

At present the workmen on the Stickle mine are at work sinking a sump. A cross-cut has been run across the vein, which is found to be 16 ft. in width, and of excellent quality. As soon as the sump is finished the work of running levels will begin, and this will be in a short time.

KERN COUNTY.

BIG TUNNEL.—Havilah *Miner*, July 26: Our prominent mining men have a scheme on foot for running a tunnel through the range of mountains west of Havilah. The idea is to tunnel the mountains from a point about half a mile east of the McKeadney mine; tha tunnel to run in some places almost a mile beneath the surface and in a westerly direction. The tuunel will, without doubt, cut many rich veins of gold-bearing quartz, many of which are known to rib the mountains, and in other places are lost in a perfect labyrinth and net work of all grades and sizes. A great mining interest will be developed by this enterprise. The leaders of the project entertain the most sanguine hopes of striking rich blind veins enough to pay expenses. Over 500 veins are known to exist in the range of the tunnel; the tunnel, if completed, will be several miles in length.

RICH CHIMNEY.—An immense new chimney of rich ore has been struck in the Bright Star mine. The amount of rock is estimated to be worth several hundred thousand dollars.

KELSO CANON MINE.—The tunnel in the Bella lode has opened a 2 ft. vein of $55 rock. A nice little fortune in sight. Old Kelso is taking a new start, like all the rest of the mines.

JOE WALKER MINE.—The new steam pump has only been running 6 days, and has accomplished as much as the first pump did in 45 days. The most flattering prospect of the water being speedily removed from the mine is now entertained. The new pump is kept in constant operation day and night. It is estimated that no less than 50,000 gallons of water are taken out per hour when running at its lowest speed. The water is now nearly 200 ft. below high water-mark.

JIM CURRY, the discoverer of the famous Gonid & Curry mine at Virginia, is stopping in this mining district to make another fortune. He thinks this county is a good for gold prospects as Nevada for silver. Old miners believe in our mines.

Nevada.

BRISTOL DISTRICT.

SULTAN.—The cave of which was discovered in this mine last week, proves to be of considerable extent. It has been entered for a distance of 20 ft., where it closes up to so small an aperture that a man cannot got through till the hole is enlarged. The walls are a solid mass of ore, of a higher grade than has heretofore been found in the mine, and a good deal of it is decomposed. Still sinking the main incline in the ledge, which shows better than ever.

CAVE.—Running the main tunnel ahead, and drifting to open the mine, preparatory to taking out ore on a large ocale. Are now extracting obout 20 tons per day.

ELY DISTRICT.

CAROLINE.—The main shaft, old works, thoroughly timbered, is 200 ft. deep. Work was recommenced last Monday, and the shaft has been sunk 10 ft. during the week. It is in contemplation to erect hoisting works shortly. This shaft was started 75 ft. to the south of the croppings of the vein, which, it is expected, it will cut at the depth of 350 ft.

CHIEF OF THE HILL.—The shaft from the Burke tunnel is now down 270 ft. Taking out some ore every day. There are about 70 tons of ore on the dump. As soon as the road to the mine, which was destroyed by the railroad grading, is repaired, they will commence shipping to the mill.

CHIEF EAST EXTENSION.—Drifting east from the main shaft on the 225-ft. level. The ledge has improved very much during the past week, and now looks exceedingly well. Taking out ore all the time, the average assay value of which is $150 per ton.

NEWARK.—We are still without reliable intelligence regarding this mine. To the stockholders who have applied to us to know why such intelligence is not made public in our Mining Review, we have only to say we cannot obtain it.

ALPS.—The lower drift is being steadily driven ahead, and it cannot be much longer before the ledge is struck, when a big thing may be confidently looked for. Taking out a large amount of high-grade ore from the upper works.

BOWERY.—A new contract has just been let to sink the main shaft 100 ft. deeper. Work on the contract was commenced yesterday. When this 100 ft. is completed the mine will be 400 feet of 500 ft., and the mine is being placed deep. Taking out some good ore all the time.

SILVER PEAK.—The new hoisting works on this mine are completed, and if it had not been for a difficulty in obtaining water, steam would have been started up yesterday noon. They will be in full operation to-morrow morning.

ECLIPSON.—Drifting, at the depth of 280 ft. from the new shaft to make the connection with the old workings, and also drifting from them with the same object. They are now nearly through, as the workmen can hear each other very plainly.

MEADOW VALLEY.—No change of consequenca to note. Taking out about the same quantity of ore, and will ship the same amount of bullion as the past month.

ORIGINAL DEXTER.—Work has been suspended for the time being, to permit the erection of a whim. The ledge never looked better.

ALADDIN.—Still sinking the shaft, which is now 149 ft. deep. The ore struck on the foot-wall is fully as wide as at the date of our last report, and maintains its average richness.

ANDES.—An incline 50 ft. deep has been sunk on the vein, which is well defined, with smooth walls and a clay casing, showing ore in bunches.

PEAVINE.—Work in the old works is still suspended, owing to bad ventilation. The new working shaft is being rapidly sunk.

MERIDIAN.—The ore in the bottom of the shaft maintains its character. Sinking steadily.

SPRING MOUNT.—Work is being rapidly prosecuted in the shaft. It is being sunk by contract—three shifts.

LOCUST.—The seam of ore in the drift shows no material variation in size or richness.

PIOCHE WEST EXTENSION.—Sinking the main shaft, which is now about 600 ft. deep. Expect to reach the ledge shortly.

BROOKLYN.—Still sinking the winze from the 75-ft. level on the ledge and taking out some good ore.

LA PAZ.—Work is still suspended in this mine.

WASHINGTON AND CREOLE.—There is no material change to note in this mine. Its production is about what it has been for some weeks past.

SCOTTLAND.—Drifting and stoping on the ledge—in excellent ore. There are about 150 tons of ore on the dump, 60 of which are first-class, high grade ore. It is now 200 ft. deep—a double shaft, each compartment 4x4 in the clear. A furnace is in process of erection for the reduction of the heavy galena ores.

SILVER CHIEF.—The Silver Chief shows a large amount of high grade ore. Two shafts have been sunk—one on the ledge 40 ft., and a main working shaft 105 ft., and a drift run from the bottom to cut the ledge 28 ft. From the developments in the upper shaft the probability of striking a large body of rich ore when the drift is pushed to the ledge is more than favorable.

SPRING MOUNTAIN TUNNEL.—Still sinking on No. 3 ledge, with constantly improved prospects of soon reaching good ore at this point. The ledge is now about 3 ft. wide, of splendid quality of quartz. The ground having been quite hard, progress has been less rapid for the past two weeks—at present much better headway is being made. Working two shifts.

MAZEPPA.—The machinery of the new hoisting apparatus works to a charm, and the main shaft is being rapidly sunk. It is still in ledge matter, but the occurrence of bunches and stringers of ore is becoming more frequent, and altogether the prospect of soon striking the ledge may be said to be extremely good.

SOUTH SIDE.—Work is being steadily prosecuted in the shaft with a full force of men.

EMPEROR.—We learn that it is in contemplation to start up work again shortly.

JERSEY STATE—Situated between the Montana and Emperor mines. Shaft in the ledge 20 ft. and a good small drift run on the ledge, which is about 2 ft. wide.

MONARCH.—The Monarch is a large, strong vein, and shows a good deal of free milling ore, assaying from $80 to $100 to the ton of ore.

TIGER.—A shaft has been sunk on the ledge about 80 ft. The ledge stands perpendicular, with well defined and smooth walls, and contains some good ore. The vein is very large—in some places over 10 ft. wide.

RAYMOND EXTENSION.—This mine shows strong croppings on the surface for a distance of fully 200 ft. assays from which have gone as high as $150 to the ton. An incline has been sunk on the vein 40 ft. showing 5 ft. of quartz with a streak of rich ore in the hanging wall.

PIOCHE PRESTO.—Work is again being steady and systematically prosecuted on this mine with excellent prospects. Drifts are being run from the new shaft at the depth in good condition for the extraction of ore as rapidly as possible.

PIOCHE.—Working the same force as heretofore, and taking out ore as usual. During the past week upwards of 135 tons of ore have been shipped to the Amador mill. Have nearly $5,000 in bullion on hand, and expect to ship $10,000 this month. No particular change to note in the stopes and drifts. The new shaft is down 140 ft. It is a double shaft, each compartment 4½ ft. by 4 ft. inside the timbers.

PORTSMOUTH.—Work will be resumed in a few days.

VULTURE.—Work is being pushed forward, and every foot the quantity of ore increases.

CHAPMAN MILL AND MINING CO.—As the drift from the shaft on the 420-ft. level penetrates the mountain, the indications of the close proximity of the ledge grow stronger. Working night and day.

MONTANA.—The character of the rock in the lower drifts has changed materially in the last few days.

RAYMOND & ELY.—The hoisting works are being rapidly put in place, and we learn from Captain Day that he expects to resume work on the mine about August 1st.

SUMMER.—A shaft has been sunk on the ledge, about 150 ft., showing throughout the entire distance a well-defined lode, varying in size from 6 to 18 inches. In the bottom of the shaft the men have encountered a very singular formation. On both sides are large cavities, and in one corner the bottom of the shaft absolutely dropped out, showing a regular cavern, perhaps a foot wide and 10 deep. The whole place appears to be badly broken up, but what ore there is is much richer than heretofore, and there can scarcely be a doubt that on reaching a firmer foundation below the vein will be found solid and of paying quality. Since then the shaft has been thoroughly timbered, and what sinking has been done, shows the vein slightly increasing in size. Working three men on a shift.

HAVANA.—We yesterday paid the Havana a visit, to see if the reports of the rich strike were based on the solid foundation of pay ore. The vein showed itself in a narrow seam of ore on the surface. A perpendicular shaft has been sunk 140 ft. where the ledge was cut. It was about 5 ft. wide, with the best defined walls we have ever seen in the camp, and dipping to the south at an angle of 75 deg. From this point it gradually widened, till it was necessary to leave it, which was done, and an incline carried down on the foot wall. Where the hanging wall was left, the vein was about 9 ft. wide. The incline has now attained a depth of 110 ft. from the bottom of the perpendicular shaft, and about 6 ft. from the bottom, the rich strike to which we alluded, was made. The rich streak is now fully the width of the shaft, and dipping towards the hanging wall. What is its extent is therefore yet unknown, but about 30 ft. above a cross-cut was run 15 ft. without striking the hanging wall, from which fact it is reasonable to infer that it will prove to be a very large body of ore. Assays of the mass ranged from $120 to $600 per ton.

HICHLAND DISTRICT.

LONE STAR.—The Lone Star is situated about 2 miles from Mendha Mill, in the midst of a large tract of timber lands owned by the company. It is a strong, well-defined vein, has been opened to a depth of 48 ft. by a shaft, at which point it shows a fine body of high grade ore fully justifying, in the opinion of our informant, the extensive developments that the company propose immediately undertaking. Assays of the ore range from $150 to $000 per ton. A large additional force of men will be put to work within 20 days.

SECRET CANON.

THE HONODON MINE.—The surface indications at the Hodgdon ore of the most flattering kind, but up to the present time no very large body of ore has been discovered. Main shaft 50 ft. deep, with excavated chamber 15 ft. from the surface. Traces of ore are seen all through this excavation, but in no very great quantity does it occur. The shaft from here passes through a sort of pudding-stone formation, with ore indications intermixed. At the bottom nothing different has been found. Work upon the mine is carried on, day and night.

THE JONES MINE is situated on the west side of the mountain. A short drift has been driven into the hill, from the end of which an incline is run 65 ft. From this two drifts have been put in, the first of which comes in ore, and the second also, but finally emerges into the country rock. The Jones shows a very good body of ore, and has already shipped 90 tons.

THE SARSFIELD is on the east side of Austin Hill, and has a tunnel 200 ft. long, but not a very flattering display of mineral from it. A perpendicular exploration, however, shows a more encouraging prospect.

WASHOE.

CROWN POINT.—Gold Hill *News*, July 25: Daily yield 450 tons of ore. The main south drift on the 1,400-foot level is making steady progress, the face in porphyry. The flow of water from the east cross-cut from this drift has somewhat decreased, and another cross-cut, 60 ft. further south, has been started to assist in draining the water. Both the north and middle winzes on the 1,300 ft. level continue lurich ore. The winze from the 1,200-ft. level is looking finely. Ore breaks throughout the mine are looking and yielding splendidly, and the prospects of rich returns to the shareholders have never been more flattering than at present.

BELCHER.—Daily yield 450 tons of high grade ore. All the stopes are looking remarkably well. The main south drift on the 1,300-ft. level is still being driven ahead, the face in rich ore. The west cross-cut from this drift is in ten ft., the entire distance in excellent ore. The east cross-cut from the south drift on the 1,300 ft. level is in 21 ft. Fine ore is encountered all along. The incline is down 209 ft. below the 1,200-ft. station. Have commenced running a drift from the Jacket incline for the purpose of opening up the 1,400-ft. level. The general appearance of the mine is very flattering.

DAYTON.—Work in the main drift west at the 225-ft. level has been stopped for the present, on account of strong indications of a heavy body of water, which the management do not desire to tap until the new station at the 312-ft. level is completed, and the shaft sunk 25 or 30 feet below that station, so as to afford a good sump. There is but little doubt that a good paying mine will be opened when the ledge is tapped.

SILVER HILL.—The main north drift at the first station has penetrated to within 75 ft. of the company's north line, the face still in good ore. The ore stopes on this level are still looking and yielding finely. Daily yield, 60 tons of ore, keeping the Bacon mill steadily running. The main northwest drift at the second station has reached to within 50 ft. of the point where it is expected to strike tha ore body found on the upper levels.

CALEDONIA.—The main north drift on the 500-ft. level has cut during the week some good ore, with excellent indications of finding a large body. The north winze, from the 400 to 500-ft. levels, is down 75 ft., with good indications of a steady continuation of the ore body found on the 400-ft. level. There is nothing new to report of the main south drift on the 500-ft. level, except the steady progress of the work.

CHOLLAR-POTOSI.—Daily yield 150 tons of ore, the assay value of which is $30 per ton. There is no change whatever to report of the ore breasts on the different ore-producing sections of the mine. The east cross-cut from the main northwest prospecting drift at the north station is still driven ahead without change of interest to report.

ARIZONA AND UTAH.—The shaft is now down 310 ft., the rock in the bottom working finely, and the sinking making excellent progress. No water to interfere with the work. The incline in the main east drift is down 90 ft., the bottom still in low-grade ore.

BALTIMORE CON.—The steady flow of water from the north drift on the 450-ft. level has greatly impeded the progress of the work for the past week. The prospect of finding a fine body of ore on this level is steadily improving. The water on the 225-ft. level is gradually lowering, being undoubtedly drained by the north drift of the 450-ft. level. The bottom of both the north and south winzes on the 225 ft. level, are drained sufficiently to permit of again commencing the sinking. Both are in good ore.

OVERMAN.—There is no change of interest to note in either the main, west or south prospecting drifts on the 1000-ft. level. Both are making steady progress. The main northwest prospecting drift, on the 1000-ft. level, has cut several small feeders and stringers of quartz during the week, with a considerable increase of water. The water in the shaft has gradually drained until the sinking can be resumed in a very short time.

CON. VIRGINIA.—The flow of water from the main north drift on the 1167-ft. level continues without intermission, rather increasing in volume, if anything, and completely stopping the onward progress of the drift for the present. Sinking the shaft is making excellent progress, the rock blasting well. The new hoisting machinery is fast approaching completion, and the future prospects look bright and hopeful.

YELLOW JACKET.—Still drifting and cross-cutting on the 1400 and 1,600-ft. levels, without change of interest to report.

NEW YORK CON.—Sinking the shaft is making good progress, the rock in the bottom working well. The flow of water from the bottom has increased to about 8 tubs an hour, but does not materially interfere with the progress of the work. The pump at the 250-ft. station works to perfection, keeping the water completely drained to that depth.

JULIA.—Tuesday last one of the hoisting ropes parted, causing a delay of 3 or 4 days in draining the water flowing from the south cross-cut at the 1000-ft. level. The cable has been repaired, and hoisting tha water again resumed. The main cast drift on the 800-ft. level is still driven ahead, the face in vein matter of a very promising nature.

JUSTICE.—The east cross-cut from the main south drift on the 400-ft. level is in sixty ft., the entire distance in the ledge. The water has been drained from the old Waller Defeat shaft, and two drifts, one north and the other south, have been started at the 200 ft. level. The north drift shows some favorable indications of ore.

SAVAGE.—The main south drift of the 1700-ft. level to connect with the north drift on the same level from the Hale & Norcross, is making steady progress without change of interest. The cross-cutting on this level has developed nothing of importance since our last report. Sinking the incline is making fair progress.

UTAH.—Sinking the shaft is progressing downward at the rate of 3 ft. per day, the rock in the bottom working finely. The supply of water is continuous and steady, but does not interfere in the least with the progress of the work. Excavating for the erection of the new pump is making good progress.

MINT.—The east cross-cut, from the main southeast drift has been steadily driven ahead during the week, the face in vein matter, and promising indications of soon striking the main ledge.

DANEY.—The shaft is down 160 ft., the sinking making excellent progress. Some little water has been encountered, but not enough to in any way impede the progress of the work.

SIERRA NEVADA.—Daily yield, 60 tons of ore. There is no change of interest in any of the ore-producing sections of the mine. The mill is kept steadily running on ore from the mine.

NEVADA.—Sinking the new shaft is making excellent progress, although the rock in the bottom is quite tough and hard to blast.

HALE & NORCROSS.—Daily yield 25 tons of ore. The north winze on the 1700-ft. level has been sunk to the depth of 110 ft., and cross-cuts run east and west from the bottom of the winze a distance of 50 ft. each, without finding any considerable body of ore. No change of material interest in any portion of the mine.

GOULD & CURRY.—The northwest prospecting drift on the 1500-ft. level is still driven ahead without change of interest. The cross-cutting in the main south drift on the 1600-ft. level has developed nothing of material value as yet. No changes of interest to report of the other portions of the mine.

AMERICAN FLAT.—The south drift from the main west drift on the 450 ft. level of the Baltimore, is still driven steadily, though slowly ahead, the flow of water greatly impeding the progress of the work. The indications of finding a good body of ore on this level are very flattering.

KNICKERBOCKER.—The southwest cross-cut from the main west drift on the 400-ft. level is still driven energetically ahead, the face in quartz and porphyry, which give some very good assays, although no large body or pay ore has been encountered yet.

LOWER COMSTOCK.—The shaft has attained a depth of 30 ft., the rock at the bottom working better than at any time since the shaft was started. A small quantity of water has been struck in the bottom, but not enough to impede the progress of the work. As soon as the shaft has attained a depth of 100 ft. the Co. propose to erect machinery.

OCCIDENTAL.—Daily yield, 35 tons of ore. The ore breasts are looking well and yielding finely. A much larger amount of ore can be extracted daily whenever it is desirable to do so. The mill is kept steadily running on ore from the mine.

CROWN POINT EXTENSION.—Sinking the shaft is making excellent progress. It is now down 75 ft., the rock in the bottom blasting and working well, and no water to interfere. The sinking is progressing at the rate of 3 to 3½ feet per day.

LADY WASHINGTON.—The work of getting the machinery in place ready for operations is fast approaching completion. Sinking the shaft will be resumed in a short time.

OPHIR.—Sinking the shaft is making steady progress, though the rock at the bottom is much harder than heretofore. Prospecting the different levels continues without any developments of importance since our last report.

EMPIRE.—The upraise, on the 1,600-ft. level, is making good headway, with no change of interest to report. The cross-cute east, on the 1,700-ft. level; have developed nothing of value since our last report.

SENATOR.—Sinking the shaft is making steady progress, the bottom in very promising vein matter, which gives small assays of gold and silver, indicating a near approach to the main ledge. The shaft is now down 380 ft.

BUCKEYE.—Work on the different levels progresses as usual, with no important changes worthy of note. The mill is kept steadily running, and the future prospects look very encouraging.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office, San Francisco:

SAN JOAQUIN VALLEY WOOL GROWERS' ASSOCIATION, July 28.—Object: to raise, purchase and sell wool and sheep, to lease and purchase sheep ranges. Trustees—James Morton, John Barber, T. S. Milton, J. Tyler, Jr. and M. L. Ahrsmsky. Capital stock, $250,000, in shares at $10 each, of which $125,000 have been subscribed.

MENDOCINO LUMBER COMPANY, July 30.—Object: To purchase timber lands, erect mills, and do a general lumber business. Directors—James B. Ford, Alfred Godefrey, Edward C. Williams, Henry P. Bowie, and William Sillem. Capital stock, $500,000, in 500 shares.

INCREASE OF CAPITAL STOCK.—The Seattle Coal and Transportation Company has filed a certificate of the increase of the capital stock to $3,000,000 with the County Clerk. The amount of the capital stock paid is $240,000; the whole amount of the debts of the Company does not exceed $40,000.

TROUT fishing is to be one of the fashionable amusements in California in the future. Many gentlemen, stimulated by the success of the California Acclimatizing Society, are building ponds at their country residences, and making arrangements to raise trout systematically.

Gold in Alaska.

It eeems that Alaska has greater merits than being a mere fog bank and land of snow, for, in addition to eeveral otber sources of productiveness already diecovered, it turns out that the mines there are likely to amount to something, after all. Until recently we have had very vague reports from there. We heard that ore had been sent to the city, which averaged about $300 in gold per ton. If, however, the claims amount to anything in extent and permanence, a number of people will probably migrate thither next year. A correspondent of the Alaska *Herald* writes as follows about the mines, from Sitka: Beyond doubt the gold mines of this place have been talked of in San Francisco; and as they are the general topic of conversation here, I will give a correct history of them from the data of tbeir discovery. The first work done in quartz was by William Dunlap and Frank Mahoney in March 23d, 1872, at a small ledge on Indian river, about one mile from town. A quantity of rock was eent from this ledge to San Francisco, in care of Capt. Tuttle of the brig *Lucas*. The captain had agreed to see that the ore was aesayed, but whether he did or not is unknown. Samples of the rock were, about tbe eame date, sent per eteamer, via Portland, to J. H. Kinkead, of San Francieco, and from it the shippers heard nothing. Another lot was seut to Mr. Fisk, of Portland, and hie assay gave twenty cents per ton in silver; but witb his return came a report from Portland, tbat the eame rock assayed fifty dollars to the ton in gold. Work on this ledge was now suspended, and Dunlap, Mahoney and E. Doyle started out prospecting.

Going to the head of Silver Bay, distant twelve milee from town, they entered a creek, and with lumber on their backs, ascended near two miles and commended sluicing. After several days work, in constant rain, without success, they quit slnicing and concluded to look for quartz. Taking a branch of the creek a little below the point at which they had been at work, and ascending the same, Doyle soon sighted a ledge of white rock running across tha stream, and as it showed a width of about six feet the party concluded to see what it contained. Tracing the ledge into the bank of the stream, and commencing with pick and shovel, they soon found what they tbought to he tha color of gold.

With a quantity of rock they returned to town, and upon exhibiting it, some pronounced it gold bearing and others not. Among the latter was a soldier of this garrison, who profeesed to be an old California quartz miuer. The discoverers, knowing but little about quartz, placed coneiderable faith in his unfavorable estimate, and did not further prospect the ledge. The soldier, however, on finding that the ledge was not likely to be worked, made inquiries as to its location, and tha discoverers, thinking it was all right, gave him the landmarks. Tbe result was, that on the 25th of December laet tbe ledge was "re-located" by the soldier and two other persons. Returning to town, the claimants produced epecimens showing a richnese of gold, and stepe were at onca taken by them towards organizing a compaby and establishing a claim to the mine. The original discoverers now believed they had made another important discovery, viz., that they had been "sold" by the honest soldier-miner, and they witb difficulty ooncealed their chagrin.

Another Ledge.

A short time after this another ledge was discovered by this same individual, but tbe snow prevented prospecting. As soon ae the weather became favorable, the second discovery was vieited, and found to be a beautiful ledge about eix feet in width and situated on the same stream as the former, at a distance of one mile above. From this ledge rock has been taken showing considerable gold. At first it it was feared that the ledge would not produce the color after striking it below the surface; but now that it has been tunneled ten feet, gold ehowe iteelf more freely than ever. A company known as tbe

"Alaska Gold Mining Company"

Has been formed, and the ledge is being worked, tha owners of it feeling sanguine that their fortunea are about made.

Aaide from these three ledgea spoken of, othere have been discovered, and othera will be, for the whole country hereabouta is quartz. Whatever the result of these mines, I shall stand ready to inform the readers of your journal; but should they prove ever so valuable, not much is likely to he done this year, inaamuch as Sitka is, in a measure, out of the civilized world. Our only facility for communicating with pointa at which we can tell the news of a lucky "strike" is per "Ben'a" boat, and it only comes eemi-occasionally. Besides, our minea have not the capital to push the work ahead, and ere moneyed men invest, they must either aee the mines themselves or send others in whom they can rely to reconoiter for them.

Great Excitement

Prevaila over returne from the assay office at Portland, just received per ateamer, whicb show that the rock sent below from the "Haley Ledge" is worth $276 per ton in gold. The rock from Indian river assayed notbing.

The Haley mine ia to be worked now in good earnest; and prospecting parties are preparing to aearch the mountains far and near.

American Cowslip, or Shooting Star.—*(Dodecatheon Meadia.)*

No wild flower of Great Britain, Switzerland and other parts of Europa is more justly celebrated on ite native soil for its beauty and its early appearance iu spring than the world-renowned primrose. Its botanical name, *Primula*, from the Latin *primus*, refers to its being first to flower. One of its many species, *P. Veris*, or spring primrose, is the noted English Cowslip.

The odd and saucy-looking flower which our engraver has accurately represented here in its natural eize, is the most beautiful member of the primrose family among the native flowers of California and other parts of the United States. Hence its common name, American Cowslip.

Gray telle us it is found in rich woods, from Pennsylvania and Maryland to Wisconsin and southward. Ha also adde, that it is called in the West, Shooting Star; alluding, no doubt, to the manner in whicb its flower-leaves are turned back. This gives each bloom somewhat the appearance of the bright head of a meteor, followed by a train of light.

AMERICAN COWSLIP OR SHOOTING STAR.

The reason for this common name is much more apparent than for the systematic one, *Dodecatheon*, from two Greek worda, meaning the twelve gods, in allusion to the twelve chief divinities of the Romans. To pronounce correctly, it is accented on the third syllable. This name was given fancifully by the eminent Linnæus himself, and we are at a loss for its application, unless it be that he wishes thus to stamp it pre-eminently as a crowning glory among our wild flowers. The specific name, *Meadia*, was given in honor of a Dr. Mead, of Virginia, by Catesby, a pioneer of American Botany, through whom it was first introduced into England from Virginia, as early as 1744.

Loudon, in his Encyclopædia of Plants, describes no lees than five different varieties of this handsome plant, with white, rose-colored, and lilac flowers. Gray describes but one species belonging to the older States, its flowers rose-color, or white.

At least three varieties are common to California, tbe white and the cream-colored belonging to the hard, knolly lands of our plains, the rose-colored found only in tha mountains.

In the white, which is the most common variety, each flower-leaf, varying in number from five to eight, is a pure white with a straw-colored spot at the base. This is followed by a ring of a deep velvet-like purple, then a second and smaller ring of a bluish purple. At the base of each of these rings are small yellow spots. In the center of the flower, the stamens and pistil unite in a spike of a bluish-black hue.

The variety and delicacy of coloring make the entire appearance of the flower one of exquisite beauty. Its odor is strong and spicy, like cinnamon, and very similar to that of the most fragrant pinks. Its roots are fibrous, its leaves oval, small and radical, resting flat upon the ground. From the center of these arises a single flower stalk, usually from six to nina inchas high, without a leaf, and surmounted by a cluster of drooping flowers, varying from four to ten in number. The work of the engraver, as in all object-teaching, gives a more accurate idea of the plant than any attempt at description can possibly do.

To offer a short lesson in botany for those of our readere who may not have had an opportunity to study that beautiful and useful science, allow a brief explanation here of a few technical terms, according to a former promise. It will enable auy one who wishes to do so, to separate a flower into its different parts, that is, to *analyze* it; and will preveut such terms from being an unknown language in the future to those who wish to learn them.

Every perfect or complete flower, such as the lovegrove, violet, cowslip and pink, is naturally divided into four parts, called the calyx, the corolla, stamens, and pistils; the first name being of Greek, the remaining three of Latin origin. Calyx means cup. It is the outer covering of the bud, is usually green, and is frequently divided into parts like small leaves.

Corolla means little crown. It is the colored part which we generally call the flower, and when opon it usually rests on tha calyx, as if in a cup. It surmounts the flower-stem like a crown. It may be single, or divided into separate parts. Inside of the corolla we find small, thread-like members, of two different shapes. The outer ones are called stamens, meaning threads. Those in the center. and attacbed to the upper part of the young seed-pod, are quite unlike the stamena in form, and are called pistils, from *pistillum*, a pestle, so much do some of them resembla the pestle of a druggist's mortar.

It ehould be further remembered, that, wben the calyx and corolla are separated into parts, the parts of the calyx are called sepals; of the corolla, petals.

Linuæus discovered, but little more than a hundred years ago, the difference of sex exists in plants as among animals, and that etamens are males and pistils females in the world of flowers.

The calyx and corolla of a flowar may be wanting, and frequently are; but stamens and pistils must be present for the plant to reproduce its kind. Flowers may have but one stamen and one pistil, or several of each.

On this simple principle, Linnæus based a sysby which all the flowering plants known in the world are arranged is Classes and Ordere. Tbe number of stamens forms the Class; the number of pistils, the Order. Each Class contains two or more Orders. To each he gave suitable names, most of which were derived from tha Greek words for man and woman and the Greek numerals. For example a plant whose flower has but one stamen and one pistil belonging to to the Class *Monandria*, literally a plant with one man, that is one stamen, and Order, *Monogynia*, meaning a plant with one woman, or ona pistil, and so on for other Clesses and Ordere.

Linnæus thus divided the whole Vegetable Kingdom into two great Sectione, the Flowering and Flowerless plants, the latter being either entirely without stamens or pistils, or not showing them. The former Section ie divided into twenty-three Classes, while all Flowerless plants, such as a fern, a moss, a eeaweed, and a fungus, being comparatively small in number, form but a single Class, the twenty-fourth and last.

In this way he reduced the knowledge of plants to a science, and is hence called the Father of Botany. Hie plan is known as the Artificial System, and though it has to a great extent given away to the Natural System of Jussieu, eo called because it classifies plants more in accordance with their natural qualities and resemblances, it will always be a useful aid to studente of botany. It was Linnæus, too, who invented the plan of giving a double name, in the Latin language, though sometimee derived from Greek, to every plant and animal in the world. The first name, like *Dodecatheon*, makee the *genus*, and is called the generic name; the secoud, as *Meadia*, makes the *species*, and is called the specific name. The first corresponds to a man's surname, the second to hie given name. The order in which they are placed follows tbe Latin usage, in putting adjectives after their nouns. The plan reminds us of rolls, mada out in alphabetical order, in whicb the surname comes first.

On these simple principles, all the 150,000, or more, different kinds of plants throughout the world have been named and classified, or will be, so soon as they becoma known to naturalists, tbus erecting to the geniue of Linuæue a monumant more lasting than marble or brass.

Most of these points have been explained, eepecially to call attention to a difference between the American Cowslip, as found in California, and the speciee described by Prof. Gray. He says the Eastern kind has the calyx 5-cleft; corolla 5-parted, with 5 stamens and 1 pistil. In the California speciee, the calyx is from 5 to 7-clift, usually 6; corolla 5 to 8-parted usually 6; stamens 5 to 7, usually 6; pistil 1.

The primrose of Europe, according to Loudon, blooms from March to June; our Cowelip, from February or March to May. Prof. Gray speaks of the Eastern species as very handsome in cultivation. So, no doubt, would our epecies be a most valuable addition to the choice flower gardene of California.—*Ralph Rambler in Illustrated Press for July.*

Decision of a Mining Suit.—The San Felipé Mining Company, Galen M. Fisher, Charles H. and Alfred Wheeler, instituted a snit in February last, in tha District Court of the Sixteenth Judicial District, in and for the oounty of Inyo, against M. W. Belshaw, E. Judson, Victor Beaudry and Wm. L. Hunter, to recover the San Felipé mine and $1,000,000 damages, the value of the rents, issues and profits. This action came on for trial at a epecial term of the Court, held at Independence, on the 10th instant, Judge Belden, of tha Twentieth District, presiding in the place of Judge Theron Reed. Paul W. Bennett, General Freeman, B. S. Brooks and John McHenry appeared as counsel for plaintiffs, and P. Reddy and Wm. H. Patterson for defendants. The case involved many legal questions of great importance; but before the respective parties had closed their testimony, the rulings of the Court had pruned down the case to a simple question of fact as to the identification of the San Felipé ledge. Its location being prior, in point of time, to that of the Union mine, it wes claimed that tha Union was located on the San Felipé lode; and upon this point a great mass of testimony accumulated during the progress of the trial, which continued for nine days, the Court meeting at 8 o'clock A. M., and and continning in session every day until 6 o'clock P. M., taking only the usual recess for dinner. The charge of the court to the jury was admitted on all sides to be an able and impartial exposition of the law applicable to the case; and, after two hours deliberation, the jury returned a verdict for tha plaintiffs.

To give an idea of coal production it may be remembered, that with 100,000,000 tona a girdle of coal 3 feet wide and 7 feet high might be put round the earth.

Useful Information.

Style in Chamber Sets.

Thirty or forty years ago, walnut was scarcely used in furniture; the mahogany four poet windlass bedstead, with a mahogony bureau, mahogeny sink lined with zinc, and lifting lid, and a toilet table of the same material, comprised the genteal chamber set. French bedsteds with windlass bottoms were also used to some extent, but not largely. Maple and birch was used for the less expensive sets, either with a cord bottom, or sacking, for the bedstead, with a mahogany bureau and washstand.

Black walnut gradually worked itself into favor mainly through the scarcity of mahogany and consequent high price of the solid wood, as compared with walnut. Thus, by degrees, the black walnut chamber sets have come into favor, and through their extended manufacture, coupled with the use of the wood for other purposes, the consumption has become so enormous, that, if it continues, there must be a great scarcity.

In furnishing a house a great deal of taste can be displayed, with a corresponding fitness, by the dealer or by the purchaser. For instance, suppose a room to have on it paper and carpet of some of the neutral tints, now so much in vogue; what is prettier, or more appropriate, than a set of chamber furniture made from maple, or ash, ornamented with some of the richer woods? or in a chamber furnished with a carpet and wall paper of a pearl or other fancy tint, a pine set painted to match, tastily ornamented with a slight scroll, or a narrow stripe, (not daubed,) will give a beautiful effect to the room, and show exquisite taste combined with economy; while for the spare or guest's room, an elegant walnut chamber set well complete the *tout ensemble*.

The same remarks will also apply to the dining room, so far as ash and maple are concerned. In the drawing room and parlor the use of wood does not enter so largely in the furnishing, so that the purchaser has an excellent opportunity to gratify tastes such as these named. A library furnished with black walnut carries with it a certain degree of solitude and richness, and for that place no wood can be more appropriate. Chestnut, when new, looks very pretty in a chamber set, and this wood can also be ornamented with some of the richer woods, although for this purpose mahogany is preferable, as the contrast between black walnut and chestnut is so great that it is apt to give a sombre appearance. No wood can fill the place of mahogany for many purposes, nor is there any full substitute for black walnut; but while the latter is used so much faster than it grows, and the cost of transportation increases as we go further for it, it is well for manufacturers to turn their attention to some of our native woods that can be used instead of it.—*Cabinet Maker.*

Cheap Vinegar.—A correspondent of the Cincinnati *Gazette* relates his experience as follows: I will give you my method of making vinegar. I consider that it is decidedly the most economical way to make this useful article, needed by every house-wife. I take a quantity of common Irish potatoes, and wash them until they are thoroughly clean, and then place them in a large vessel and boil them until done. I now drain off carefully the water that I cooked them in, straining it, if necessary, in order to remove every particle of the potato. Then I put this potato water into a jug or keg, which I place near the stove, or in some place where it will be kept warm, and add one pound of sugar to about two and one-half gallons of the water, some hop-yeast, or a small portion of whiskey.

Prepared in this way, and letting it stand three or four weeks, you will have most excellent vinegar. Indeed, it is the only vinegar that will preserve cucumbers cut fresh from the vines, without the aid of salt. If I have not plenty of potatoes, when I am boiling them for family use I put on more water than is necessary to cook them, and drain off the water and treat it as above described, diminishing the ingredients to suit the amount of potato water. The whole cost of really superior vinegar made in this way does not exceed six or seven cents per gallon.

Wheat Measurement.

A bushel of wheat in New York, Ohio, Pennsylvania, Indiana, Wisconsin, Iowa, Illinois, Michigan, Massachusetts, Kentucky, New Jersey, Vermont, Missouri and Canada, is sixty pounds. In Connecticut it is fifty-six pounds. Rye is fifty-six pounds to the bushel in all the States named but Illinois, where it is fifty-four. Corn is fifty-six pounds to the bushel in all the States named but New York, where it is fifty-eight, and Missouri, where it is fifty-two. Barley is forty-eight pounds to the bushel in New York, Ohio, Indiana, Wisconsin, Iowa, Michigan, Kentucky, New Jersey and Canada. In Pennsylvania it is forty-seven; in Illinois forty-four; in Massachusetts forty-six, and in Vermont forty-six.

A legal stone weighs 14 pounds, or the eighth of a hundred, in England, and sixteen pounds in Holland.

How Envelopes are Made.

One of the most interesting examples of the manner in which manifold and complex machanism is now made to do the work of human fingers, is that by which envelopes are now produced by means of machinery recently introduced in England. A pile of envelope blanks is placed on a plate on the left-hand side of the machine, this being done either when at rest or when in motion. A hollow brass tube, with an end of a peculiar shape, descends upon the envelope blanks at the side nearest to the folding-box. To the other end of the tube is attached an India-rubber pipe communicating with an air-pump which, coming into action at this instant, causes the blank which is upon the top of the pile to attach itself to the brass tube, which, rising, carries the envelope blank with it. A pair of grippers then run forward, and, seiziug the blank, carry it into its proper position over the folding box; after which it is stamped, and the gum applied in the proper places upon the two side flaps—this movement being singularly ingenious, At this point, a plunger descends and carries the blank into the folding-box; upon the plunger rising, slides working in the thickness of the folding-box run in and inclose the flaps in their proper order. The bottom of the box now rises and completes the operation by pressing the envelopes against the slides; the bottom of the box then falls and allows the envelope to drop in an upright position into a trough running under the machine, when it is met by a simple contrivance, which secures the envelope with its flaps in proper position in the trough, and, as each successive envelope is placed in front of it, it gradually works along the trough until removed by the attendant and handed.

Good Health.

Vegetable Food.

The question as to whether we should encourage a greater consumption of vegetable food, is discussed by Dr. Hoy as follows:

This question is one of hygiene. If a greater consumption of vegetable food would add to the health, strength and happiness of the people, we should by all means encourage it.

In the first place, location, climate, etc., are to be considered. Men require different food in different climates. The Esquimaux would not long survive as a vegetarian; the Asiatic would be destroyed by a diet of fleeh and oil; but, as we inhabit a temerate zone, neither of the extremes are applicable to us. As man is an omniverous animal, a mixture of animal and vegetable food would here seem most proper.

Let us examine a few results. I have observed closely some people who refused meat of any kind, and I found those who made use largely of eggs and milk, the only two things that contain all the elements of the human body, enjayed excellent strength, health and fair complexion, indicating a full supply of proper substenance. On the contrary, those who confine themselves to vegetables alone were sickly looking and greatly lacking in physical strength.

In the Crimean war it is said the English soldiers withstood the hardships of the trenches, cold and labor much better than the French, who were furnished with a much lighter food; and in consulting the English surgeons, they attributed the failure to a lack of meat; and on the French army being supplied with the English ration of beef, they were able to endure the cold and fatigue equal to their English neighbars.

I read in the book of Genesis that Joseph's brethren went down into Egypt for corn when famine was in the land of their nativity. They exhibited such extraordinary feats of physical power as to astonish the Egytians greatly; and when Joseph was interrogated as to the cause, he said it was on account of their living on pulse (vegetables) and an abundance of milk, (they being herdsmen,) eating no meat.

Before the deluge I find no account of the ancients eating meat. (Genesis I, xxviii.) Herb bearing seed and every tree bearing seed, or seed in the fruit, were man's food, and perhaps that was one cause of their long lives in those days.

It is a fact too notorious to require argument, that people living on bread and meat mostly are more billious, more subject to fevers, are less healthy, and do not attain to the age of persons making use of a more mixed diet.

By a wise and most beneficent arrangement of nature, a great variety of fruits and vegetables mature at a time when people are exhausted by the summer heats and toils of the season, the system requiring just such sedative, acidulated and cooling properties as they contain. A free and judicious use of them is plainly indicated by the requirements of the system, and adds largely to the comforts and pleasures of life. Their use, therefore, should be strongly recommended to all classes, and their most extensive production encouraged.

To Prevent Falling Off of The Hair.—The most satisfactory treatment, according to the *Druggists' Circular*, is the use of *tannin*, one and a-half scruples with one ounce of *adipis*.

Delicate Surgery.

Experiments on Living Brains—Interesting Discoveries.

Lengthy particulars are given in the Dundee *Advertiser*, of the important discoveries as regards the brains of animals, recently made by Dr. Ferrier. Dr. F at the invitation of Dr. Crichton Brown, went to Wakefield and was amply provided with cats, dogs and other animals for his experiments. The animal to be experimented on is first put under chloroform. The next thing is to clear away the skull and expose the brain. This, it will be understood, is a difficult operation, but is done, and the animal may live from three hours to four days. All this has been done often enough before, but the difficulty was to get some mode of rousing parts of the brain into activity without injuring the parts. Here Faraday comes in. Such is the way of scientific discoverics—every step leads to the next. Without Simpson and chloroform the operation could not have been successfully attempted. Without Faraday the operation might have been performed a thousand times without leading to any result.

After uncovering the brain, Dr. Ferrier applies the point of an electrode to the convolutions of the brain. Its effect is to excite the functional activity of that part and thereby to show what its real work is. One of the first experiments disclosed the part that is employed in wagging the tail. Soon after the centres engaged in supplying the limbs, the mouth, head, etc., were discovered. Nothing could surpass the interest of these experiments. On the table before you is the dog with its skull removed. All seems, but for the breathing and movement of the brain, an inert mass of dead matter. The doctor applies the electrode, and presently the tail begins to wag; all else is motionless. Another touch, and its forepaw is stretched out; another, and its head is erected; another, and its mouth opens. Again the magic wand touches the brain, and the animal seems convulsed with fear and rage; and so on experiments go. Once the divining rod has been discovered, it is comparatively easy for an expert vivisector to use it. This discovery, so simple once it is known, will effect almost a revolution in physiology

Hitherto it has been looked on as an axiom that you cannot experiment with the brain—that it is too near the seat of life to be tampered with. Now, experiment has been introduced into a region where we had reconciled ourselves to the vague and uncertain light of observation. There can be no doubt that we shall soon know the particular use of every convolution of the brain. Phrenology, from the stage of empirical observation, will become a science.

It also has demonstrated that the nerves moving the muscles of the jaw are just above the ear, where the phrenologists place gustativeness. But other experiments made lead havoc with the locality of many of the "bumps." The most singular of all the experiments is one proving that one of the main uses, if not the sole use of cerebellum is to supply the muscles of the eye. But the most important immediate effect of Dr. Ferrier's discovery will be an improved treatment of diseases of the brain. It has found out why considerable portions of the brain may be diseased without interfering with sanity, and why other slight lesions produce epilepsy. It has succeeded in artificially producing epilepsy in a dog. This is a most wonderful part of the discovery, and proves the truth of the conjecture of Dr. Hewlings Jackson, that epilepsy arises from a lesion between two convolutions of the brain. Dr. Ferrier has also found out the origin of chorea or St. Vitus's dance, and has been able to make his animals show all the symptoms of the diseases artificially.

The Healthfulness of Lemons.—When people feel the need of an acid, if they would let vinegar alone, and use lemons or apples, they would feel as well satisfied and receive no injury. A suggestion may not come amiss as to a good plan, when lemons are cheap in the market. A person should then purchase several dozen at once, and prepare them for use in the warm, weak days of the spring and summer, when acids, especially citric and malic or the acid of lemons, are so grateful and useful. Press your hand on the lemon and roll it back and forth briskly on the table to make it squeeze more easily; then press the juice into a bowl or tumbler—never into a tin; strain out all the seeds, as they give a bad taste. Remove all the pulp from the peels, and boil in water—a pint for a dozen pulps, to extract the acid. A few minutes boiling is enough; then strain the water with the juice of the lemons; put a pound of white sugar to a pint of the juice; boil ten minutes, bottle it, and your lemonade is ready. Put a tablespoonful or two of this lemon syrup in a glass of water and have a cooling healthful drink.—*Farmer's Union.*

To Curl Hair.—Take two ounces borax, one drachm of powdered gum Senegal, one quart of hot water, (not boiling;) mix, and as soon as the ingredients are dissolved, add two ounces of spirits of wine, strongly impregnated with camphor; on retiring to rest, wet the hair with the above mixture and roll it in papers as usual; leave them till morning, then untwist and form into ringlets.

Domestic Economy.

Stewed Beef.

Housewives who are in a habit of using only steaks and roasts make a great mistake. A capacity dish may be made out of the "chuck" as the butchers call it, or the neck, when well prepared. Select a piece of meat as large as the demand of your table may require, wash it well to remove all the blood or soil from the outside, have your dinner pot perfectly clean, salt and pepper the meat well, lay it on the bottom and cover it with water; boil it from two to three hours, or till it is thoroughly tender; add half an onion, a sprinkle of sage, thyme or summer savory.

If the meat is fat, let the water all stew out a half an hour before it is put on the table, and when your meat is browned well on the lower side in the gravy, turn it over and brown the other side. When ready, take it up, add a little flour thickening to the gravy; or, if you have a dredge-box, shake the flour into the hot gravy and brown it, then add boiling water and you will have a dish equal, and to my mind superior, to the common roast beef upon boarding house tables.

Care must be used to turn it; and equally necessary is good judgment in having it thoroughly well cooked.

Honor Pudge.—An exchange prints the following recipe, at the request of some of its readers, and endorses it as making an excellent relish:—

Take of unripe tomatoes three-fourths in bulk; and of cucumbers and onions one-fourth; using less of onions than of cucumbers, if you like. Pare the cucumbers, and if they are quite ripe they are just as good. Chop all up fine, then mix them together. Place them in a dish that will hold them, salt to taste, and let them remain over night. In the morning turn off the pickle and throw it away. Into the mixture stir two spoonfuls of whole cloves. Take the same quantity of whole cloves and of white mustard; tie them in a thin cloth, and put them in vinegar enough to cover the whole mass. Bring the vinegar to a boil, and let the spice remain in it until the hodge podge is all used up. Cook the preparation five minutes in vinegar, and draw off the vinegar in which it has been cooked, and throw it away. Then place the mass in a stone jar, and turn over it the vinegar in which the spice had been boiled. Cover and set away to use as desired. Half-a-pound of sugar to a gallon of hodge podge, if you like.

To Clean Glass Water Bottles.—Take a potato, just as it comes from the market, cut it into small bits, and put them into a bottle. Shake the bottle up and down and around and around for some time, after which add a very little water and shake again. Turn out the potato and rinse the bottle well with clear water, when it will become perfectly bright. If not much furred, another method may be used. Some tea leaves from the tea-pot, with a small quantity of soda, may be allowed to stand for a time in the bottle, and then well shaken about in it; after which it should be rinsed out with cold water, when it will be found to be quite clean.

To Mash Turnips.—Pare, wash clean, if large, split in quarters and put in boiling water, and boil till very tender. Lay them when done between two plates—wooden trenchers if you have them—and press out all the water; if too old to press free from lumps, pass through a coarse hair sieve by rubbing with a wooden spoon. When free from lumps, put them in a clean saucepan, and set over the fire three or four minutes, till quite dry, stirring all the time. Then put in salt and pepper to suit the taste; add a great spoonful of butter and half a cupful of cream; simmer five minutes and serve hot.

Household Education.—Children hunger perpetually for new ideas. They will learn with pleasure from the lips of parents what they deem it drudgery to study in books; and even if they have the misfortune to be deprived of many educational advantages, they will grow up intelligent, if they enjoy in childhood the privilege of listening daily to the conversation of intelligent people. We sometimes see parents who are the life of every company which they enter, dull, silent and uninteresting at home among their children.

If they have not mental activity and mental stores sufficient for both, let them first use what they have for their own households. A silent house is a dull place for young people, a place from which they will escape if they can. How much useful information, on the other hand, is often given in family conversation, and what unconscious but excellent mental training in lively social argument. Cultivate to the utmost all the graces of home conversation.

Punch's notion of nobility is that a man of birth is commonly one whose remote ancestors did something and his immediate predecessors for many centuries, nothing at all.

A WONDERFUL GOLD MINE has been found in the Argentine Republic, in the Province of Rioja. A correspondent of the New York *World* sends a most glowing account of the new discoveries, but his statements are so highly colored as to lead one to suspect their truth. The "find" is attracting great attention in Buenos Ayres, and people there, judging from the *World's* letter, are wild on the subject. "The simple fact that a provisional transfer title has been drawn up for the sale of two leagues of this immense auriferous deposit, by which the immense sum of $100,000,000 in currency is to be paid, is the best evidence of the confidence that is placed in the result of the discovery." The mines are said to have been found by a German who went to the country to prospect. He found the "colors" and then bought up all the land very cheap. The terms of the sale mentioned above are, that one-fourth of the purchase money shall be cash and the rest in installments. The owners expect a return of $33,000 per day. A regular "'49 gold fever" is the result of these discoveries. We hope this correspondent of the New York *World* is more to be relied on than the one who wrote them the account of the discovery of the Open Polar sea by the Pavy Expedition, when the Pavy Expedition existed only on paper, and the illustrious leader was still in this city.

CHERRY CREEK MINING District is said to have splendid surface indications in its ledges, but as none of them have been sunk upon to any extent, their permanence is of course yet to be proven. Some of the ore taken out is very rich. We see by the Eureka *Sentinel*, that one of the mines there—the Exchequer—has been bonded to parties in this city for $40,000. The owners intend to erect a mill soon, in case the property is not disposed of under the bond.

A NEW SILVER mine is reported as having been discovered on the head of Drunken Gulch, a tributary of Sherlock's creek, Mariposa County. The mine is on the northwestern slope of Mount Bullion, nearly opposite Bear Valley.

Paul's Automatic Mill.

Recent experiments in Utah, Nevada and California having directed attention to the system of amalgamation known as Paul's Process, we devote considerable space in this issue to the first correct description of the new automatic mill which has yet appeared as the subject is one of great interest to the mining community. The method has been known for several years, but is only now coming into extensive notice, like many other inventions—the Stanford self-feeders for batteries, for instance—which are only now coming into general use on the Comstock and elsewhere, after 14 years from the time they were first patented; in that case but for the renewal of the patent through our Agency, the inventor would have lost all benefit of a valuable patent. The idea of handling ores and mercury, automatically, has been attempted separately, with success; but the effort of making a mill from beginning to end, weighing, registering, cleaning up and all, automatic, has not been before attempted. Why all the work connected with milling ores cannot be done mechanically, we cannot see. At all events Mr. Paul has struck out in a new and very important field, which we think will tend to enhance the value of our quartz mining interests. The system of amalgamation as well as the mill embraces new ideas and will be read with interest.

This mill and process, on which Mr. Almarin B. Paul, of this city, has been so assiduously engaged for the last six years, is at last fully completed, and all who have examined into its merits and details pronounce it not only complete in its operation, but perfectly practical in every respect. Of the last mill erected at Springville, Utah, Mr. Cole Saunders, of Montana, who visited it, thus expresses himself in the Salt Lake *Journal*: "It is the best-constructed automatic mill I ever saw, and does fully all that is claimed for it in the way of crushing ore. The amalgamating barrel and settlers work beautifully, and four men in twenty-four hours can do the work of ten men in an ordinary mill." The owners of this mill, in a card which we published several weeks since, pronounce the mill a splendid success and ordered a duplicate; no higher recommendation could be given.

From the very incipiency of this new plan of "electro-chemical dry amalgamation," and from the fact that Mr. Paul, a man of over 20 years practical experience with quartz machinery and ores, was giving it his attention, the PRESS has had great faith in its resulting in an important advance in modern milling operations. Making machinery perform the labor of men is one of the great features of American inventors, and the skill displayed in this respect, excites the wonder of Europeans as well as ourselves. The machine should be seen at work to be appreciated. Our readers must understand first, that all the ore is crushed, pulverized, and the precious metals amalgamated "electro-chemically" in a perfectly dry state, water being only used for separating.

The operation begins by loading a hopper with quartz for the stamps. This hopper can be made of any size, to hold pounds or tons. The stamps when in motion operate on the automatic feeder connected with the hopper, and the battery is thus fed with more exactitude than by hand. The battery reduces the ore coarsely, say to the fineness of number 30 wire or 900 fine, thus enabling the battery to do double the work ordinarily done in dry crushing. The crushed ore drops on an incline plane and slides down an endless belt, which conveys it to the hopper of the pulverizing barrel. This barrel being self-feeding, the ore is at once delivered inside for further reduction. The reduced quartz from the battery is here triturated by larger pieces of quartz, by the revolution of the barrel. The ore is here chemically treated and warmed by electric heat. The barrel is so arranged as to be self-discharging, and as fast as the ore becomes fine enough it passes out of the way. By a very complete arrangement of sieves the ore finally passes through No. 90 wire mesh or 8,100, at the same time at least half the ore will pass through a 10,000 mesh, making an average fineness of about 9,000, or ten times finer than when it leaves the battery.

It has been acknowledged by all experienced quartz miners that down to a certain fineness, no system of reduction has been found as cheap as stamps, but to reduce ores to a powder, the wear and tear and expense as compared with work done has made them objectionable to many. This one plan of bringing ore to a flour, by a plan which would be sufficiently expeditious, and at the same time simple and cheap, cost Mr. Paul a great deal of labor. The ore, as it passes by its own gravity from the screen, being tightly encased, falls upon the floor and is immediately taken up by the conveyor and delivered to the elevators, such as are usually used in flour mills. These deliver the ore into a hopper, where the ore is weighed and registered automatically, and by the movements of this weighing arrangement, a signal is given, notifying the amalgamator that the charge is ready. The position of the amalgamating barrel is such, that by opening a valve, all the ore in the hopper at once delivers itself into it, and without making any dust. Into this barrel goes the mercury and some more chemicals; it is then closed and set in motion. During these revolutions Mr. Paul claims, "that the metals and mercury are in such electrical condition, that the base ore is in antagonism with the mercury and cannot be amalgamated, while the precious metals are in harmony and become absorbed by it."

Amalgamation completed, which generally requires from 30 to 60 minutes, the ore from the amalgamating barrel is delivered into a main settler, where water for the first time comes in contact with the ore. The settlers differ but little from the ordinary settler, excepting they are more complete in many essential parts. To this settler is attached an apparatus whereby the mercury precipitated and gathered at once leaves the settler, carrying with it its charge of the precious metals in amalgam, either gold or silver. If gold, it is deposited in one receiver; if silver, in another. These receivers are in fact safes, where the treasure can be held under lock and key, if so desired. The surplus mercury after depositing the amalgams, then passes unseen through iron tubes to a point where it is taken up automatically, and the amalgamator finds it when wanted at the barrel, ready for using again.

This "cleaning up," as it were, goes on at every charge delivered into this settler. The operation is performed without a grain of sand or a drop of water being discharged. It is based on the specific gravity of the different metals and ores, regulated by a dial; its work is very perfect. After an hour's operation in this settler from 90 to 95 per cent. of all the mercury is discharged, as also its amalgamated metal. The material in the first settler is delivered into a second where the ore is again treated according to the character of ores being worked. The ore in this settler after treatment is "quicked" as usual in the patio and discharged as in the first settler. A third settler is used when the character of ores requires, the aim being to treat the combination separately, and if desired the base metals, such as lead and copper, can be precipitated and taken up in amalgam by this settler. From the settler the whole material passes over blankets which are washed automatically. The amalgamator it will be seen, is only required to have his attention to the operation at stated periods, to open valves and draw plugs. He has not a pound of anything to lift.

One of the most remarkable features connected with the system, Mr. Paul tells us, is that it applies as well to gold as to silver, and silver as well as gold, and that no base metals, in any form in metalliferous ores, are taken up by the mercury unless so desired, while in all other systems they cause trouble by becoming incorporated into the amalgam, and cause great loss of both mercury and metals. This fact is one which Mr. Paul has found it difficult to get the mining community to accept. But they cannot dispute it in the face of so many practical proofs. The Utah mill produced bullion 995–1000 fine. Mr. Paul thinks he has discovered some new electrical law, as applied to metals, and which we understand he intends applying it in some other direction as soon as he gets this work sufficiently before the public, so that it will require less of his attention. And in this is the secret why the whole science of the system has not been laid more openly before the public. The benefit of a system which produces almost pure gold and silver at so small an expense as from $3 to $5 per ton of ore is beyond calculation. This system Mr. Paul has styled the "American Barrel System" as distinguished from the "Freiburg Barrel System."

Another good feature connected with this mill is that every single portion can be stopped or started without interfering with the working of any other portion. Notwithstanding the mill is so thoroughly automatic and cheap in working it is cheap in construction and operation. It is to be hoped that Mr. Paul's labors will be fully rewarded, as he has consumed much valuable time to say nothing of thousands of dollars, in experiments, during the years he has been engaged on the invention. But few individuals would have prosecuted the work so persistently as he has and been so careful in their experiments.

THE *Silver State* says specimens of native copper were found this week, in a large chamber of silver ore in the Arizona mine. Native silver is also visible in the same pieces of ore which contain the copper.

A WIRE TRAMWAY for conveying ore from the Mendha mine to the mill in Robinson District, Nev., will soon be completed. It is expected to carry 30 tons per day, at a cost of $1.50 per ton.

THE SALT LAKE STOCK AND EXCHANGE BOARD is in full operation and holding daily sessions. An additional excitement for Salt Lake!

RICH COPPER AND SILVER ORES have been found in a spur of the Humboldt Range, about eighteen miles south of Unionville, Nev.

THE SOUTH DAYTON Mining Co., Washoe, have nearly completed the erection of a new and well constructed set of hoisting works.

ONE THOUSAND TONS MORE IRON have been ordered for the Sevier Valley and Pioche Railroad.

New Mining Districts.

In December last R. O. Jacobs in company with W. L. Kennedy and R. P. Stewart discovered a highly argentiferous belt of lodes running through the Panamint mountains, in Inyo county, California. A correspondent of ours writes us that these discoveries are beginning to attract considerable attention, and every indication there adds strength to the opinion, that the new district will ultimately become one of the rich silver producing localities of the Pacific Coast. The ledges thus far discovered and located crop out conspicuously, and show an average amount of metal, most important among them is the lode called the "Wonder of the World," discovered by Jacobs and Stewart. This lead is truly a monster, measuring in some places 30 feet in thickness and will probably average five feet for a distance of 3,000 feet. Many assays have been made from this, and in every instance the result has been of a flattering character, some of them have gone as high as $3,000 per ton.

A town site has been surveyed, a Recorders office established, and about 100 locations have been recorded. Among the principal pioneers and owners are R. C. Jacobs, Dr. A. K. Stearns, R. P. Stewart, A. C. Lawrence, D. G. Tipton, James Scobie, Henry Gibbone, J. Dempsey and Chunn and Copely. The new town site is situated at an elevation of almost 5,000 feet above sea level. The predominating geological feature of the locality is lime formation. We will shortly have a more detailed description of the country and a careful report on developments.

A dispatch from Elko dated the 29th, gives an account of some very rich silver discoveries 65 miles from that place, which are causing great excitement there. Mr. M. P. Freeman with an old prospector by the name of Durfee, has just returned from the location of some extremely rich silver-bearing ledges at a point about sixty-five miles north of Elko, and near Independence Valley, on the head-waters of the Owyhee river. They brought in with them about 100 pounds of ore from the different ledges located by them. An assay made by Conrad Wiegand, at Virginia, of an average piece of rock, from the Chloride ledge, shows about $50 gold and $340 silver. Mr. Freeman represents that here are from 200 to 300 tons of this ore lying on the top of the ground as float. Among the ore brought in is about four pieces of horn-silver and black sulphurets, from the Chloride ledge, an assay of which, made by the same assayer, shows the enormous result of $7,280 silver per ton or nearly 50 per cent. of metal. They also brought in several pieces of gold bearing quartz that are completely specked with free gold. The country in the immediate vicinity is described as being the garden spot of Nevada, the hills being covered with bunch grass and the valleys with clover knee high, and the entire country being alive with prairie chickens and sage hens. The Owyhee River affords magnificent water power, and the only thing that is lacking is a sufficient quantity of timber, the country being almost destitute of wood of any kind. The different classes of ore have been on exhibition, and crowds have been flocking to get a sight at it. The dispatch says that every spare man in Elko will be off to the new camp within the next few days. Work will be begun at once on the ledges located, and if the result verifies the anticipations of all those who have seen the ore and heard the locations described, this district will be the next objective point of a tremendous stampede.

OVERLAND FREIGHT.—The shipments of through freight from this city to New York, Boston, St. Louis, Chicago and other eastern cities, for the six months ending June 30th, aggregated nearly 12,000 tons, valued at over $5,000,000. Most of the articles were of California production. The *Bulletin* has compiled a table showing the monthly shipments for six months, from which we condense the following: For six months the borax shipped was 141,900 pounds; butter, 102,634; coffee, 1,835,588; cotton, Taheiti, 123,616; fish, salmon, 1,113,958; flour, 162,350; glue, 166,652; hides, 264,915; hops, 74,951; leather, 737,492; nuts, 149,080; quicksilver, 230,040; silk, foreign, 309,724; sugar and syrup, 78,876; tea, 2,926,273; wine, 1,379,110; wool, domestic, 12,337,263; wool, foreign, 874,199; merchandise, 890,709; total, 23,899,355 pounds. In addition to this, through

shipments have been made to the east from San José, Stockton, Sacramento and Marysville, equalling 2,655,032 pounds, which added to the San Francisco shipments makes a total of 23,554,367 pounds. Of that shipped from the latter cities mentioned, were 20,090 pounds of borax, 176,400 pounds of fish, 340,000 pounds of flour, 266,026 of wine, 488,595 pounds of wool from Sacramento; Marysville sent 1,040,000 pounds of flour. The principal articles forwarded, were wool, 13,700,057 pounds; leather, 776,321; wine, 1,682,620; flour, 1,542,250, tea, 2,926,434; and coffee 1,835,588 pounds. Of course these are only railroad shipments *through*, neither way freight nor that shipped by vessels being considered.

Lake Tahoe.

This charming lake, so well known to tourists as one of the beauties of California, is the subject of our engraving this week. Paintings and word descriptions, fail to convey a full idea of the true loveliness of the lake and its surroundings, and an engraving can only give the outlines of a scene which must be visited to be fully appreciated.

The lake is situated at an altitude of 6,218 feet above the level of the sea, in the midst of the Sierras, and is 35 miles long and 15 miles broad. In some places it is more than 1,500 feet deep, and the idea once prevailed that it was bottomless, with reference to all ordinary means of taking its soundings. The water is peculiarly clear, cold and transparent, and for half a mile from shore, objects at the bottom are seen as distinctly as if only a few feet away.

The scenery around the lake, like most of it in the Sierras, is magnificent and grand. The higher mountains in the vicinity are covered with eternal snows, and the hills near by, to the north and east, are densely thicketed with forests of fir, balsams, pines and oaks; while along the southern shore are beautiful meadows of grasses and clovers, furnishing ample forage for extensive dairies of cows during the summer season.

A steamer and several boats have been placed on the lake, but the sudden gusts of wind which sweep down the gorges from the hills, are dangerous for nautical recreation. The waters abound with trout of several varieties, and many of them of large size, which not not unfrequently find their way to the San Francisco markets in their season. We would advise all our readers who have the time and means, to make a visit to this enchanting locality, and see the beauties of the scenery. Facilities for camping out, as well as good hotels, abound along its shores.

LAKE TAHOE.

The Stetefeldt Furnace.—In speaking of the proposed sale of the Taylor mill, at Mineral Hill, last week, we mentioned that the Stetefeldt furnace there was of no value. Of course the idea we intended to convey was that the furnace was of no value in that particular case, as the class of ores there can be worked by pan process, without the need of a chlorinizing furnace. As this fact was not known at first, the furnace was erected. We make this explanation as several persons misunderstood the paragraph in last week's issue.

A Tunnel through the ridge between Beer River and the north Fork of the American River near Cape Horn, Placer County, is again talked of, and the *Alta* thinks the project has this time assumed a practical shape. The proposed tunnel will be over two miles long, and will cost half a million dollars. This is another step in the right direction, designed to utilize rich tailings and work hydraulic ground.

The Pacific Glass Works, located on the Potrero, suspended operations last week. We regret to see any of our manufactures compelled to suspend, as in them we look for the permanent prosperity of the country. This leaves us but one glass factory—the San Francisco, at the foot of Fourth street,—to supply the demands of the coast.

The Popular Science Monthly.

This valuable publication is now well advanced on its second volume, and has constantly increased in interest and importance, from the start. It seems to be just the publication that is needed to enable the popular mind to keep up with the progress of science. It was started to help on the work of popular science, by supplying instructive articles on leading subjects of scientific enquiry, and well has it thus far accomplished its mission. Its articles have been well and carefully written, and in a clear and comprehensive style; while the subjects have been most judiciously chosen. Each number comprises about 140 pages, has some ten or twelve leading papers extending over a wide range of knowledge, and furnishes such a variety as to well adapt it to every taste and condition of life.

The magazine is one which is really much needed, and it cannot fail to do a most effective work in fostering and increasing the growing taste for popular, scientific education. It gives us just what the popular mind needs in science-teaching—a clear account of what is known; accurate reasoning as to what may be inferred, and a careful record of the passing history of research and investigation.

No man in the country has labored, for years past, more zealously or more successfully in disseminating among the people popular scientific information, than has Prof. E. L. Youmans, the accomplished editor of this magazine; and much credit is due to the publishers, D. Appleton & Co., of New York, for the excellent judgment they have displayed in so successfully putting the right man in the right place. Prof. Youmans has been very properly termed a missionary of science, sent to convert the people to a proper appreciation and understanding of the great truths which are being so rapidly opened up to the world by the scientists of the present day; for it is largely through his efforts that the people of this country have been so generally led to read and become acquainted with such authors as Farraday, Tyndall, Herbert Spencer, Secchi, Huxley, Lubbock, Darwin and others, whose original investigations and vigorous writings have of late so interested and set the whole world to thinking and study.

No man who makes any pretensions to a love for philosophical research in any department of such inquiry, should be without this magazine. No graduate, especially, of any college, academy or high school, can keep up with the progress of science and thereby secure the fullest continual benefit of their education without the help of such a publication. By the constant perusal of the successive issues of such a work, the mind will be kept ever active and interested in the progress of science, without which an education soon becomes comparatively worthless, but with which the educated man will be able to so carry on the work of self-instruction as to keep pace with even the wonderful studies of modern research and discovery. The magazine is published for $5 per year, and may be had off the publisher direct, or of A. Roman & Co., of this city.

Scheme of Blowpipe Analysis.

* In our last issue we made some remarks on the "Blowpipe and its use," and in continuation give the "scheme" referred to at the end of the article:

The substance may contain *antimony, arsenic, bismuth, cobalt, copper, gold, iron, lead, manganese, nickel, quicksilver, selenium, sulphur, silver, tin, zinc; chlorine, bromine, iodine.*

Abbreviations: Ch., charcoal; O. F., oxidizing flame; R. F. reducing flame; S. Ph., salts of phosphorus.

I. Treat on Ch. with the O. F.

An *odor* as of horse-radish denotes *selenium.*

A *white* coating easily driven off by merely warming with the flame and giving a *garlic odor* *arsenic.*

A *white* coating, melted with S. Ph., and reduced on Ch. with tin, giving a black bead *antimony.*

A *yellow* coating, giving with S. Pb. and tin, a black bead, disappearing with blue flame (*lead*), yielding no greenish flame (of *antimony*) *bismuth and lead.*

The same, without the flame (of *lead*), but with generally a white border and greenish flame *bismuth and antimony.*

II. Melt with soda on Ch.; moisten and lay on bright silver. A stain on the silver denotes *selenium or sulphur.*

If selenium was present (horse-radish odor), roast in open tube. The fumes turning blue litmus paper red, denote *sulphur.*

III. Heat in a closed tube with dry soda. If present, you get *quicksilver.*

IV. Drive off the volatile substances on Ch. with O. F. Treat with R. F., with or without soda. A white coating giving, with cobalt solution, a grass-green color, denotes *zinc;* a blue-green color denotes *tin.*

V. Mix some of the substance with assay lead and borax glass, and fuse on Ch. with the R. F. Cupel the lead button for *silver.*

Treat the silver bead with nitric acid for *gold.*

VI. Roast the substance well on Ch. and dissolve in borax. Treat the borax bead on Ch. with a small piece of lead (or gold or silver) in a strong R. F. One gets a slag which may contain *iron, manganese and cobalt,* and a button which may contain *nickel, copper, silver, gold, tin, lead and bismuth.* Separate the button from the slag.

A. Add to the slag more borax, and melt on platinum wire. *a.* A blue color denotes *cobalt.*

b. A bead green while hot, and blue when cold *iron and cobalt.*

c. The same bead oxidized and becoming violet or nearly black *manganese.*

(Test especially for *manganese* with S. Ph. bead and nitre.)

B. Oxidize the metallic button (VI) on Ch. to drive off all the lead. Melt the residue on Ch. in the O. F. with S. Ph.

a. A bead, green while hot, and blue when cold *copper.*

b. A bead, green hot and cold, *nickel and copper.*

c. A bead, brownish-red while hot, and yellow when cold *nickel.*

(Test especially for *copper* with tin on Ch. in R. F. Copper, if present, will show red.)

VII. Dissolve oxide of copper in S. Ph. on platinum wire with the O. F. to an opaque glass. Add a little of the substance and treat with the tip of the blue flame. An intense azure-blue flame denotes *chlorine or bromine.* An intense green flame denotes *iodine.*

Fuse in a matrass with bisulphate of potassa. Reddish-yellow vapors denote *bromine;* violet vapors, *iodine.*

*Plattner's Manual of Qualitative and Quantitative Analysis with the Blowpipe from the last German edition revised and enlarged by Prof. Th. Richter. Translated by H. B. Cornwall, A. M., F. M., assisted by John H. Caswell, A.M., N. Y.; D. Van Nostrand.

The Hoisting Works in the Auburn mine were totally destroyed by fire on the 30th ult. Two men were in the mine at the time, but were rescued after the fire, having received no serious injury.

The Santa Rosa Coal Mine shows good indications of permanency.

Patents & Inventions.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents]

By Special Dispatch, Dated Washington, D. C., July 29th, 1873.

For Week Ending July 15th, 1873.

Pump and Pump Plunger.—Nathaniel P. Sheldon, assignor to Henry H. Welch, S. F., Cal.

Windmill.—John F. Stewart, Modesto, Cal.

Pavement.—Wells Kilburn, Napa, Cal.

Coupling for Gas and Water Mains.—Welle Kilburn, Napa, Cal.

Shaft Furnace for Roasting Ores.—Thomas McGlew, Austin, Nev.

Process of Making Coke from Lignites.—Henry Englemann, Salt Lake City, Utah.

British Patents for Pacific Coast Inventors.

Following is a list of inventions patented or protected by Provisional Specification in England, by inventors in the Pacific States and Territories, from January 1st to June 30th, 1873:

Motive Power to Sewing Machines.—O. J. Backue, A. F. Sawyer, of S. F., Cal., and A. M. Loryea, of Portland, Oregon.

Rotary Pump.—S. A. West, S. F., Cal., and L. Goodwin, Virginia, Nev.

Bung and Bung Inserter.—Van Laak & Gillespie, S. F., Cal.

Printing Type.—William Shaw, Hollister, Cal.

Boiler and Furnace.—F. A. Huntington, S. F., Cal.

Lubricator.—W. Burnett, S. F., Cal. (London, England.)

Water Power.—W. Burnett, S. F., Cal. (London, England.)

Boots.—T. Tucker, Oakland, Cal.

Sheep Shears.—A. S. McWilliams, Colusa, Cal.

Hydraulic Hoist.—T. Stebine, *et. al.*, S. F., Cal.

Preserving Iron.—W. H. Sterling, S. F., Cal.

Refiner for Distilling Apparatus.—W. Neil, S. F., Cal.

Tunnelling.—D. C. Haskins, Vallejo, Cal.

Ely District is again "picking up," judging from reports in the Pioche *Record*, as work has been resumed on many mines which have laid idle for months. The new and magnificent hoisting works of the Raymond & Ely mine are fast approaching completion. Plenty of men are starting in sinking shafts in solid rock, where they have no hope of return, until a depth of two or three hundred feet is reached. Few of these men have any money and they form small companies of six or eight, half of them working for wages to keep the others going. The strike in the Havana mine, mentioned in our "Mining Summary" will most probably give this class of men additional encouragement and affords a practical proof of the soundness of the reasoning which induces them to work as they do. We sincerely hope, that all the *Record* wishes for will be attained and the camp will keep up its representation as a bullion producer, which it earned by hard work and partially lost by litigation. If all the miners work as hard and as faithful to make the camp a permanent bullion producer as the *Record* has to keep the news of its locality before the public, the ends desired will surely be attained.

Gold on the Yellowstone.—One of the Montana papers states that the Yellowstone country contains gold in fabulous quantities, and an expedition has been organized in Bozeman to explore the country and demonstrate the truth or fallacy of its richness. We thought it would'nt be long before some enterprising prospectors entered the Yellowstone country on a mining expedition, and if it proves as rich in minerals as it has in natural curiosities, it will be a second El Dorado. The expedition will probably number one hundred men and will proceed to Little Wolf mountain, 200 miles from the Crow Agency. They will also prospect Porcupine Creek between Big Horn and Tongue river, where gold is known to exist. Rich placer mines are what the expedition is going to look for.

Rich gold discoveries have recently been made on Queen Charlotte's Island.

Gold Mines of Nova Scotia.

Amidst the many recent discoveries of nsw gold fiolds, there are, perhaps, none more worthy of attention than those of Nova Scotia. Within an easy distance from Europe, situated in a British possession, they offer peculiar advantagcs to British capitalists. No country in the world possesses finer harbors or is more accessible from all points. It is intersected in every quarter hy fine rivers, possesses immenss forests, and has unlimited deposits of coal and iron in addition to its gold. The climate is healthy, the population industrious and well conducted. A constant and easy supervision can always be exercised hy those intersated in gold mining there. This industry bas not, however, heen carried on as yet with the vigor it deserves, or with the energy which bas heeu displayed in more distant regions to which Britisb capitalists have not feared to trust their wealth. For this reason these valuabls fields are as yet hut imperfectly developed, and offer peculiar consequent advantages to the investor. Many causes have led to this resnlt—ths chief being the fact that the American companies, which hitherto chiefly worked the mines in Nova Scotia, did so merely with the view of immediate profits, and made no reserve for future outlays—so that when they had gone as far as their original capital allowed them, paying in the meantime large dividends, they were compelled to cease operations when greatsr depths were required to be reached and expensive machinery purchased; and the witbdrawal of labor for ths construction of the International Railway, and the opening of the coal mines. To these causes the decrease of the yisld in 1872, as compared with ths previous ysar, is alone attrihutahle. There is, consequently, nothing discouraging iu the fact. The truth is, that the gold raised up to the present time bas heen done so chiefly by what might more properly be termed exploratory works, and thongh thess have proved highly satisfactory, it is to mors extended operations that ws must look for the production which, according to all reports, may safely be expected. It is with tbe greatest satisfaction, then, that we havs learned the formation of a company to work the Pactolus mines, feeling assured that not only will they prove an excellent investment, but also an immenss advantage to the colony. It is a saying oftsn quoted, that "Distance lends encbantment to tbe view," and it is only on this supposition that the indifferencs of tbe British puhlic to such valuahle property so uear, and tbe eagerness wbich has heen displayed for sending out immense sums to far distant countries can be explained. It is to be hoped that witb the severe lessons which havs heen lately given to us, anotber spirit will he generated, and that we shall try in future to use our capital in developing tbe wealth at our doors instead of sending to points beyond our control.

In ths account of the Gold Fields of Nova Scotia, publisbed hy Mr. Hsatherington, we have, in a succinct and tahular form, the results of the statements collected in the official reports. From these the richnsss of the deposits appears in a statistical shape, which admits of no cavil; and wben compared with those of other gold-hearing regions, it is clear that the auriferous deposits of Nova Scotia equal in richness those of the districts which havs acquired fame all over the world. This is the more apparent when it is remembered that the work done bas not as yet heen of such a nature as to be ahle to reach the richer portion of the vsins, and that they have only been superficially opened up. Mr. Alfred R. C. Selwyn, F.G.S., Director of the Geological Survey of Canada, and who, dnring many years, held the sams post in Victoria, Australia, describes them in his "Notes and Observatious on ths Gold Fields of Quebec and Nova Scotia." All remarks from bim possess a peculiar value, from the author's previous experience and intimate acquaintance with the subject. They may, indeed, he looked upon as authoritative. He says that, from all he saw of tbe gold districts of Canada, he entertains the highest opinion of their importance and natural capabilities, hut he at the same time expresses a most unfavorable opinion of the manner in which they have beeu hitherto developed. Without entering into the descriptions of what has been doue, and his reason for saying tbat an entirely erroneous method has heen pursued, it will he sufficient to etate that, judging from analogy, and the close resemhlance of the formations of Nova Scotia and Australia, he considers that, in following the veins downwards, even should they appear to fall off for a time, great richness will be later attained. He, in fact, holds out grounds for expecting that theso gold mines will, with proper appliances, and a sufficient outlay, prove very remunerative, and censures the niggardly spirit in which they have, until now, been carried out. Another mistake is, that attention has been too mucb confined to narrow lodes; but when it comes to be understood that it is relatively cheaper to operate on large quantities of low grade ore than on picked lots of rich ore, wide veins yielding five to ten pennyweights, which might be profitahly worked on an extensive scale at a cost of only two or three peunyweights, will cease to he disregarded. The great succcss which attended mining in narrow veins in Grass Valley, California, is the chief cause which tends to perpetuate this capital error.

The average returns for Wine Harbor district for 1872 are worthy of notico, and, though exceptional, prove that with judicious management immense profits may be made. The yearly earnings per man there were £363 3s. 8d., an excess of £285 on the actual wages. Ore which cost about 16s. to raise and crush, yielded an average of £5. Results such as these, obtainahle throughout an entire year, show the value of the property, and ought to be sufficient to attract British capital to the field where they havs been ohtained. What has been done in one instance may be equally so in another; and tbough the same profits are not to he looked for in every case, there can be little doubt that with time Nova Scotia will rank as one of the great gold-producing regions. Already the yield of last year reached, for the province, £948,000, thougb, as stated, gold mining is only in its infancy.—*Mining World.*

Clarence King on Veins, Deposits and Limestone Formation.

[Continued.]

In our issue of July 12th we gave a portion of ths evidence of Mr. Clarencs King, in the cass of the Eurska Consolidated Miniug Co. against the Richmond Mining Co., of Eurska, Nevada. We now condenss from the continuation of the evidence, as published in ths Whits Pine *News*, such facts as ars likely to prove of interest to the gsneral reader, without special reference to their bearing upon ths merits of the case.

It will he remembsrsd that it was one of the principal points in the case of the Richmond Co., to prove that their ore body was a vein and not a deposit. To this end they exposed a great length of ore, which Mr. King pronounced a true vsin.

In the cross-exsmination, Mr. King said:

The rock, along Ruby Hill as far as the Champion workings, appears to bs a mass of cropping limestone and limestone dshris; the ground is so covered that it is impossihle to trace the presencs of the fissure, which runs through the middle (as to the dip) of ths body of the Richmond works. But the indications of that fissurs are the foot-wall previously msntioned, the plane of the original fissure, and that where the plane rises into ore the deflections underneath from that, are the resnlt of horse faultings and of solution.

If this ore should come up throngh a fissure at any part of the hill, the unimportant and lateral fissurss, as in all fissure veins, would be more or less impregnated with ore. If the lime rock wsre filled with caves all through and these wsre more or less connscted with small fissures or craoks, the ore when it came np in a molten state would be disseminated through them, so that it would be found in a variety of shapss; but the main caves and the chain of caves, would be gsnerally situated on the fissurs which gave vsnt to ths current of water to make these caves. Thers is bound to bs a central main line of fissure and this is developed, in the Richmond, to the extsnt, in all ths lsvels, of 240 or 280 feet. Its greatest development at right angles to the conrse is about 200 feet.

The shape of the ore body does not govern, in ths lsast, in deciding wbsther it is a

Vein or Deposit,

No matter how irrsgular the shaps of the pitch or course may be. There is, of courss, the precsdent of acknowlsdged fissurs veins; as, for instance, tbe Comstock, in which ths amplitude of one of the chambers is 800 fsst, and in whicb it runs down to a thickness where you cannot put a knife.

In tbis case, tbs developments have not gone far enough to maks a certain thing; but, gsnerically, it would bs termsd.

A Bed Vein, and a Pipe Vein,

Specifically. As a striking instancs of what are termsd pipe vsins, the Emma, in Utah, which has bssn classed as such hy a number of expsrts, starts from the surface in a rathsr small, insignicant fissure, followed by ore opening in a chambsr, out of which they havs taken a profit of nearly a million of dollars—a small chamber, and then goes into another chamber, in wbich they hope to find another body of ore.

Silver not Always in Veins.

Silver exists in other conditione than in veins in various parts of the world, as, for iustance, the mines of Kongsberg, in Sweden, occur in what is known ae a stockwork, and there are other places where they occur in what are known as "seggregations." These frequently occur in a large channel of ore, apparently extending to some considerable depth; but when you narrow down the formation of a stockwork, it ie nothing but an infinite number of small fissures which are filled. These are not, properly speaking, veins, auy more than a creek is a river. Between them and true veins there is one very grave distinction, and that ie, that in a stockwork ten thousand of these little fiseuree may have received their direct mineral from ten thousand other fissures which received them from ten thousaud other fissuree, and so on; whereas the true fissure vein is supposed to penetrate hy oue cleft to the deap-seated laboratory. There must bave been some large fissure from which theee ores came and then were disseminated through the smaller ones. These were the result of the main fissure, hut not the main vein any more than I should call the little stringere that go from an ordinary fissure vein the main vein.

There may not have been auy main fissure. There may have been eimply an iufinite number of small connecting fissures, altogether depending on the oountry rock which has beeu shattered from this force, which the geological authore term the dynamio push. This, instead of fracturing one regular fissure, in the case of the stockwork deposit shattered the whole rock into innumerable fissurss. Thess stockworks are practically unknown iu limestone. If, throughout the works, large bodies of ore were taken out surrounded by limestons, they would still be called veins.

Ths right hand side of this vein started in limestone, and a mass of ore cams in over the top. So that now, at the end of the drift, the upper half, or upper third, perhaps, is ore, of white carbouatee; and the limestous appears to hs rolliug ovsr towards the Lizette tunnel, a little west of north.

Irregularities of Vein Walls.

Walls are very liable to be irregular in shaps dip, course and everytbiug; and it is very little svidence that one is smooth for a short distance, but whsn there are two to compsre, it is easy to decids which is the truo wall. This has not a smooth surface even, but the dip and strike are with it.

In the Comstock, the wall turns at right angles just within the Gould & Curry liuss. I first examined tbs Comstock in 1862, and reported on it for the governmsnt in 1869. Of this report, not a particle was changed, and several prophecies in regard to the future of ths lode have proved correct.

In the rs-direct examination, Mr. King said: I gave

The Comstock Lode

As an instance of great irregularity. On the section station of the Savage, ths vein in the Gould & Curry was about 150 fset thick. The east wall turned a right angle, as I have said, and from 160 fest the vein widsns to 830 fsst, and closes again in the Chollar to nothiug; the ore body followiug from the Chollar into ths Hale & Norcross in a shsst of quartz, then running to almost nothing, then again reappearing in the Savage, turning a right augle. There is a change in about 3,500 feet of from 150 to 850 feet, and a closing together to nothing. To give an idea of ths irregularities of walls in dip, I will mention the case of the Chollar-Potosi, that being ths west wall of the Comstock, dipping at, approximately, 45° in a section of something like 350 fest. This is near the Norcross line. The thickness of the vein in that plaos, from about 400 fest on the croppings, shuts down to ths thickness of a knifs-blade, and, having hsen searohed hers for 400 feet, continues to bs a knife-blade. Abont a thousand feet of tbat liue continue to be a knife-blade and not an ounce of quartz nor a particle of anything but two walls shut together can be found. And yet no one would deny the Comstock's being a true vein. As

Another Illustration

Of great irregularity, the Acton mine in Dsrbyshirs, England, might be instanced. It is in ths carboniferous limestone, which is separated into beds and by sn argillacsous rock. The Acton, which has besn worked in what is technically known there as a pipe vein, for a little over 200 years, and is uow down 2,300 feet, opsned from a small fissure into a very large body, in limsstone.

In dsscribing the minsral deposits of the world, scientific msn have used quite a number of different tsrms to describe different kinds of vsins. These vsins we have mentioned, have been described as vsins of segregatiou by some anthorities, as Delles, the greatest French authority on the chemistry of vsins, and our own Whitney.

The Richmond Vein

Could not possibly be one of impregnatiou, because vsins of imprsguation ars in ths rock itsslf, not in chambers, openings, fissnres or holes in rocks, but permsated through the rock itself. Nothing is more commou in veius of true fissure, that are acknowledged to be such, than to find absolutsly harren zones where the country rock comes together. Ths fact, that upon the lins of fissuro ths ors bodies are not found connected, is not opposed in the least, to the tbeory given. The limestone on the boundaries of tbe more valuable ore deposite, is not itself impregnated with ore.

There are ample geologicsl proofs that this hill wae lifted up about the time of, or eoon after the triassic period. Not to go to far in the theory of the thing, we have by our enrvey of the 40th parallel very clearly proven the continuity of strata from the Mississippi to where they sink into the Pacific Ocean.

A New Source of Wealth.—Ou a small street in the rear of Meadow Valley, nearly opposite Cedar street, has been struck a mine of umber, which is of immeuse extent. That the reader may comprehend what "umher" is, we append Wehster's definition: "An ocbreous ore of iron, of a hrown or hlackish hrown color, consistiug of oxide of iron, oxide of manganese, silica, alumina and water. It is often used ae a pigment, and sometimes in coloring porcelain." Immense quantities of this ore are beiug extracted, and that, too, without a great outlay of labor. We saw yesterday a great amount, which had been drawn up with a commou windlass and placed in hags for future use. The mine is owned by Frank Nolan and others. The ore ie to be pulverized, mixed with oil and used as paint. The paint of this manufacture is to be used in paiuting the Raymoud & Ely hoisting works. A friend who is a practical painter, is satisfied that this discovery of umher will prove a eource of great wealth. By mixiug white lead with it, bigbter colors may be obtaiued. At present, all the paint needed for home use can he procured from this mine, and with railroad communication, by which it may he traneported cheaply, it oan he shipped to other points with profit. The eupply ie apparently inexhaustible.—*Pioche Record.*

PROPOSALS FOR MATERIAL

FOR A PORTION OF THE

New City Hall Building.

OFFICE OF BOARD OF CITY HALL COMMISSION-ers, corner of Leavenworth and McAllister streets, San Francisco, July, 1873.

SEALED PROPOSALS for furnisbing certain Material for a portion of the New City Hall Building and Hall of Records will be received at the office of the Board until 12 o'clock, noon, of FRIDAY, the 22d day of August, A. D., 1873, for the following:

6,000,000 BRICKS, 4,000 BARRELS LIME, 8,000 BARRELS CEMENT;

And until 12 o'clock, noon, of WEDNESDAY, tbs 1st day of October, A. D. 1873, for the following:

ROLLED IRON JOISTS, WROUGHT IRON GIRDERS All according to Specifications, Schedule, Plans and Drawings, to be furnished by the Board.

For furthsr Information apply at tbs Office of the Board.

P. H. CANAVAN,
JOS. G. EASTLAND,
CHAS. E. McLANE,

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setters made on the same principle excel all others They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setters for themselves, at the office, 229 Fremont Street, San Francisco

TO BUILDERS AND ARCHITECTS.

Brooklyn Freestone Quarries,

Three miles from the Brooklyn R. R. Depot and Landing, and 4½ miles from Oakland City Hall.

Having just completed a good road to these quarries, we are prepared to furnish large or small orders for either dimension stone, or roble stone, in San Francisco, Oakland, or Brooklyn, at such prices as cannot be competed with, for equal quality of stone; for base and elevation walls, for public and private buildings, monuments, fence walls, coping, window caps and sills, doorway trimmings and steps, stopping stones, curbing for streets and sidewalks, pavements for streets and street-crossings, bases for gravestones and plain and ornamental work for cemeteries, etc.

We can furnish cellar and basement walls of roble stone of superior quality in San Francisco at about the cost of brick work for the same.

The gray freestone from these quarries is considered far superior to that of any other within practical distance of San Francisco. It is readily worked and imperishable.

For samples we refer to the first story of the City Hall, Oakland, erected four years since, and the window caps and sills, and other finished work in the Deaf and Dumb Asylum, Oakland; in the Oakland Cemetery around the lot of J. S. Emory. Also small specimens in the offices of Augustus Laver, (Architect of the S. F. City Hall) Kearny St.; David Farquharson, Architect, Cor. Kearney and California St., S. F.

Orders may be left with George W. Thompson, on the premises, or A. T. DEWEY, SCIENTIFIC PRESS office, No. 338 Montgomery St. S. F., where samples of the stone may be seen.

PATENT SELF-CLEANING SLUICE.

This new and useful invention is designed to collect all the gold as fast as it is set free from the dissolving earth, and conduct it into a receptacle of mercury or safety pocket, under lock and key, from whence it may be removed in a few moments, without either checking the flow of water or interfering in the least with the washing.

The invention, if properly placed in our rivers, will also collect the gold which is yearly traveling down their channels, thus affording an annual income with a trifling expense for attending.

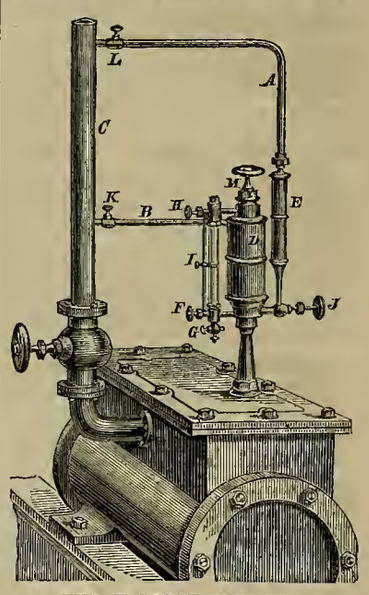
N. Seibert's Eureka Lubricators.



THE HIGHEST PREMIUM

Awarded by tha Mechanics' Institute Fair, San Francisco, and State Fair, Sacramento, 1871.

These Lubricators are acknowledged by all engineers to be superior to any they have ever used; feed constantly by pressure of condenaed water, supplied by pipe A, regulated under the oil by valve J, and forced out through check valve and pipe B into the steam pipe C; it then becomes greasy steam, paeecs to all the valves and cylinder at every stroke of the engine; glass tube I indicates amount used per hour. Packing on rods and stems lasts longer, and the rings on the piston will not corrode. One pint of oil will last from three to six days, according to speed and size of engine; I, sliding gauge; K, valve to shut off when engine stopps; H, F, valves to shut off in case of frost; steam does not enter the cup; it is always cool; warranted to give satisfaction. Patented February 14, 1871. Manufactured by California Brass Works, 125 First street, S. F. 24v23tf

Second-Hand Engines and Boilers

For Sale by McAFEE, SPIERS & CO.,

CALIFORNIA INVENTION.

CALL AND EXAMINE.

For Sewing Machines, Dentists' and Jewelers' Lathes.

This Invention can be applied to the operating of all kinds of Sewing Machines, Dentists' and Jewelers' Lathes. Its simplicity is only equaled by its durability; it avoids the use of the treadle, which is ungraceful and injurious.

Application made by the Agents for the Pacific Coast.

SAWYER & WHEDON,
1v6eowhp 633 Washington street San Francisco.

The New Wilson SEWING MACHINE

Has points of superiority over all others. A reliable warranty is given with each machine for

FIVE YEARS.

It is unequaled for light and heavy work. Examine and compare it with the highest priced machine in the market

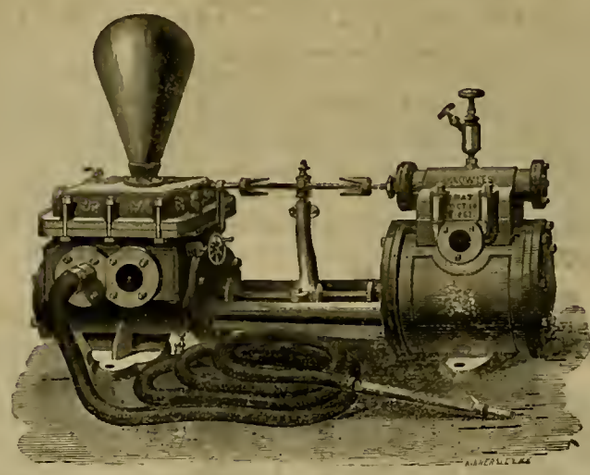
☞ BUY BARBER'S BIT BRACE. ☜

KNOWLES' PATENT STEAM PUMP.



It has no Cranks or Fly-Wheel, and has no dead points where it will stop, consequently it is always ready to start without using a starting-bar, and does not require hand-work to get it past the center. Will always start when the steam cylindor is filled with cold water of condensation.

CENTRAL PACIFIC R. R., OFFICE OF THE GEN'L MASTER MECHANIC, SACRAMENTO, Cal., January 14, 1873.

A. L. FISH, Esq., Agent of the Knowles Steam Pump, San Francisco—Dear Sir: In reply to your inquiry as to the merits of the Knowles Steam Pump, in use upon this road, I will say that it gives me great pleasure to report that they have performed their work well whenever called upon. In no instance have they failed. We have now over 30 of them in use on this road as fire engines, and pumping water for shop and station use. I consider the Knowles Steam Pump the best in use, and prefer it to any other. Yours truly, A. J. STEVENS, General Master Mechanic.

U. S. NAVY YARD, New York, June 3, 1871.

MESSRS. KNOWLES & STEBLEY, 92 and 94 Liberty street, New York—Gentlemen: In reply to your note of 31st, requesting my opinion of your Steam Pump, etc., as suggested from my experience with them in actual service, I have to state that I have used your pumps, and entertain the most favorable opinion of their great merit and usefulness, and for every purpose believe them to be superior to any others, and have so recommended and adopted them. They have given complete satisfaction in all cases that have come under my observation.

Yours very respectfully, WM. W. W. WOOD.

A. L. FISH, Agent Knowles' Steam Pump—Dear Sir: In answer to your inquiries, we state that the highest award for Steam Pumps at the Eighth or last Mechanics' Fair in San Francisco, was a FIRST PREMIUM and Diploma, awarded to the Knowles Patent Steam Pump, as published in the Official List September 23d, 1871.

A. S. HALLIDIE, President Board of Managers.

DEWEY & CO'S
SCIENTIFIC PRESS
Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical. PACIFIC RURAL PRESS—Agricultural.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others by reasons of long establishment, great experience, thorough system, and intimate acquaintance with the subjects of inventions in our own community. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent ousiness, and obtain Patents in *all civilized countries*. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most *reliable* advice as to the patentability of new inventions. ADVICE AND CIRCULARS FREE.

DEWEY & CO.,
Publishers, Patent Agents, and Engravers,
No. 338 Montgomery st., San Francisco, Cal.

A Good Binder for $1.50.

Subscribers for this journal can obtain our Patent Elastic Newspaper File Holder and Binder for $1.50—containing gilt title of the paper on the cover. It preserves the papers completely and in such shape that they may be quickly fastened and retained in book form at the end of the volume, and the binder (which is very durable) used continuously for subsequent volumes. Post paid, 25 cts. extra. It can be nsed for Harper's Weekly and other papers of similar size. If not entirely pleased, purchasers may return them within 30 days. Just the thing for libraries and reading rooms, and all who wish to file the PRESS. Iambp

SHAREHOLDERS, TRUSTEES, and SECRETARIES of ALL MINING COMPANIES.

Should see to it that their Notices are advertised legally in THE DAILY MINING PRESS, of the MINING AND SCIENTIFIC PRESS, at much less less cost than the usual rates of daily publications. Every person interested in the prosperity of legitimate mining enterprises should favor such practical economy. Send for circular of convenient dates for advertising, free blanks, and a copy of the New Code Corporation Assessment Law.

Brass, Zino and Anti-Friction or Babbet Meta CASTINGS,

Church and Steamboat Bells,

TAVERN AND OTHER BELLS, GONGS, FIRE ENGINES, FORCE AND LIFT PUMPS.

Steam, Liquor, Soda, Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder and Copper Rivets, etc. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles. HYDRAULIC PIPES AND NOZZLES for mining purposes. Iron Steam Pipe furnished with Fittings, etc. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

☞ Highest Market Price paid for OLD BELLS, COPPER and BRASS. 6-tf

W. T. GARRATT, JAMES HILLMAN, W. T. LITTLE.

N. W. SPAULDING,

Saw Smithing and Repairing ESTABLISHMENT.

Nos. 17 and 19 Fremont Street, near Market.

MANUFACTURER OF

SPAULDING'S

Patent Tooth Circular Saws.

They have proved to be tha most du able and economical Saws in the Wo.d.

Each Saw is Warranted in every respect;

Particular attention paid to construction of

Portable & Stationary Saw Mills.

MILLS FURNISHED AT SHORT NOTICE

At the lowest Market Prices.

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found more economical, advantageous and reliable than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, Jnly 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. C. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah, Superintendent's Office, Sept. 28, 1872.

T. M. MARTIN, Esq.—Sir: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Superintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one t'n and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

For hoisting from mines, transmitting power, ship rigging etc., of all kinds and sizes, on hand and made to order.

Wire of all kinds and descriptions, furnished at lowest rates. A. S. HALLIDIE, 113 and 115 Pine St.

MINING AND SCIENTIFIC PRESS.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 9, 1873.

VOLUME XXVII. Number 6.

The New City Hall.

Religion is represented by vast and costly cathedrals, which seem rather the work of angels than of men; nations by their legislative halls, and cities by their civic palaces. Around many of the latter cluster historic memories, as full of interest in their way as those which shed a halo of glory around the former. All the great cities of Europe boast of memorial edifices, around which in days gone by the fathers of the people have battled; and American cities are already beginning to follow their example. The magnificent edifice which we illustrate in this issue of our paper, with its towers and domes and spires and pinnacles that point to heaven, will be the future Hotel de Ville of San Francisco, and will reflect peculiar lustre on the brain that designed it and the citizens whose liberality has been so magnificently displayed in its erection.

The Ground,

Between Park Avenue and Larkin and McAllister streets, is triangular in form, containing about six acres, of which four will be covered by the building. The whole will be surrounded by a level terrace, which will be 11 feet high at the Hall of Records. From the terrace to the top of the parapet the height of the building will be 84 feet.

The length of each of the triangular fronts of the building will be as follows: on Park Avenue 800 feet, on McAllister Street 660 feet and on Larkin Street 500 feet. The Hall of Records, wherein will be deposited the archives, etc. of the city, will be surrounded nearly altogether by an arched piazza of 136 feet, the inner diameter of the Hall itself being 86 feet. The dome of this Hall, which will be of the finest finish, will be 67 feet in diameter supported by twelve massy iron columns, forming a circle 56 feet in diameter, connected by arches springing from ornamental capitals at a height of 58 feet from the floor. The center of the Hall will be open to the top of the dome, giving an internal height of 120 feet, which surmounted by a pedestal and statue will raise the height to 135.

The Main Building

Will enclose a central court or *Atrium*, 125 feet by 121 feet, which will be surrounded by an elegant piazza. The grand entrance will be through a circular entrance hall 73 feet in diameter, with a height of 67 feet, having in front a portico 24 feet wide. The whole will be surmounted by the grand central tower about 290 feet high, which will be visible from afar and will be a conspicuous object in the appearance of the city. The whole of this vast building will be occupied by the Municipal Chambers and by the Law courts. The basement will contain the hall for the assembly of the police officers, the captain's rooms, the wardrooms, storerooms, etc., the City Prison with its various cells, etc., and the police property Clerk's and Sheriff's store-rooms, cellars etc. The furnaces, etc., for warming the building will also be located here. Next after the basement comes the ground floor or first story, the Mayor's apartments, such as Clerk's room, ante and reception room, toilet room, private office; the Police Court with Judge's Chamber, offices for the Prosecuting Attorney, Clerks, witnesses, etc., as also for the Sheriff, Superintendent of Streets, Assessor, Tax Collector, Auditor, Treasurer, Collector of Licenses, Justices' Courts, County Clerk, Probate Court, Public Administrator, etc.

The Second Story

Will be divided up with apartments for the Board of Supervisors, into Council Chamber, Committee-room, Clerks' offices, Assistant Board room and subordinate offices, County Court, Municipal Court, Twelfth and Fifteenth District Court Judges' Chambers, etc. The third story will be divided up into Grand Jury rooms, Petty Jury rooms, Law Library, Judge's studies and and offices of the District Attorney, City and County Attorney, Coroner, Board of Education, City and County Surveyor, Fire Department and Industrial School; besides many minor ones. The Fire Alarm and Police Telegraph Department will occupy the first story. The ground whereon the work as far as completed now stands was covered by an immense sand-hill, which had to be removed in order to prepare the way for the

Foundation.

A very great quantity of this sand, instead of being taken away, has, in conformity with the advice of the Superintending Architect, been left, and has been utilized in filling in the ground around the walls, and in making mortar for the building. In this way quite a large amount of money has been saved. It being impossible to secure a good foundation, an immense bed of cement, from three to six feet deep, covering the whole of the area on which the edifice is built, has been laid—said bed being itself as hard and durable as solid rock. On this the foundations, which are 10 feet higher than the cement, have been based, in which were used 2,500,000 brick, 70,000 yards of stone, and 1,000 lineal yards of granite. On this part of the building nearly $1,000,000 out of the $1,500,000 appropriated for construction have already been expended, and on

The Work as it now is,

One million, one hundred thousand dollars, leaving only four hundred thousand dollars of the original appropriation. The brick walls, which are of great thickness, rendered necessary to prevent the edifice being shaken down by earthquakes, and to support the weight of the superstructure, are now completed about twenty-five feet above the terrace, and will average, when finished, ninety-seven feet. After a careful consideration of the matter, and in view of the ravages of the great fires of Boston and Chicago, it has been recommended by the architect, and authorized by the commissioners to fire-proof the whole building. Not having sufficient money to finish the building according to the original design, it has been deemed advisable to expend the balance in finishing the Hall of Records, which could be done in about six months. Provided there was sufficient money, the whole building could be finished according to design in about two years, and at an additional expense of one and a half millions. Provision is to be made for

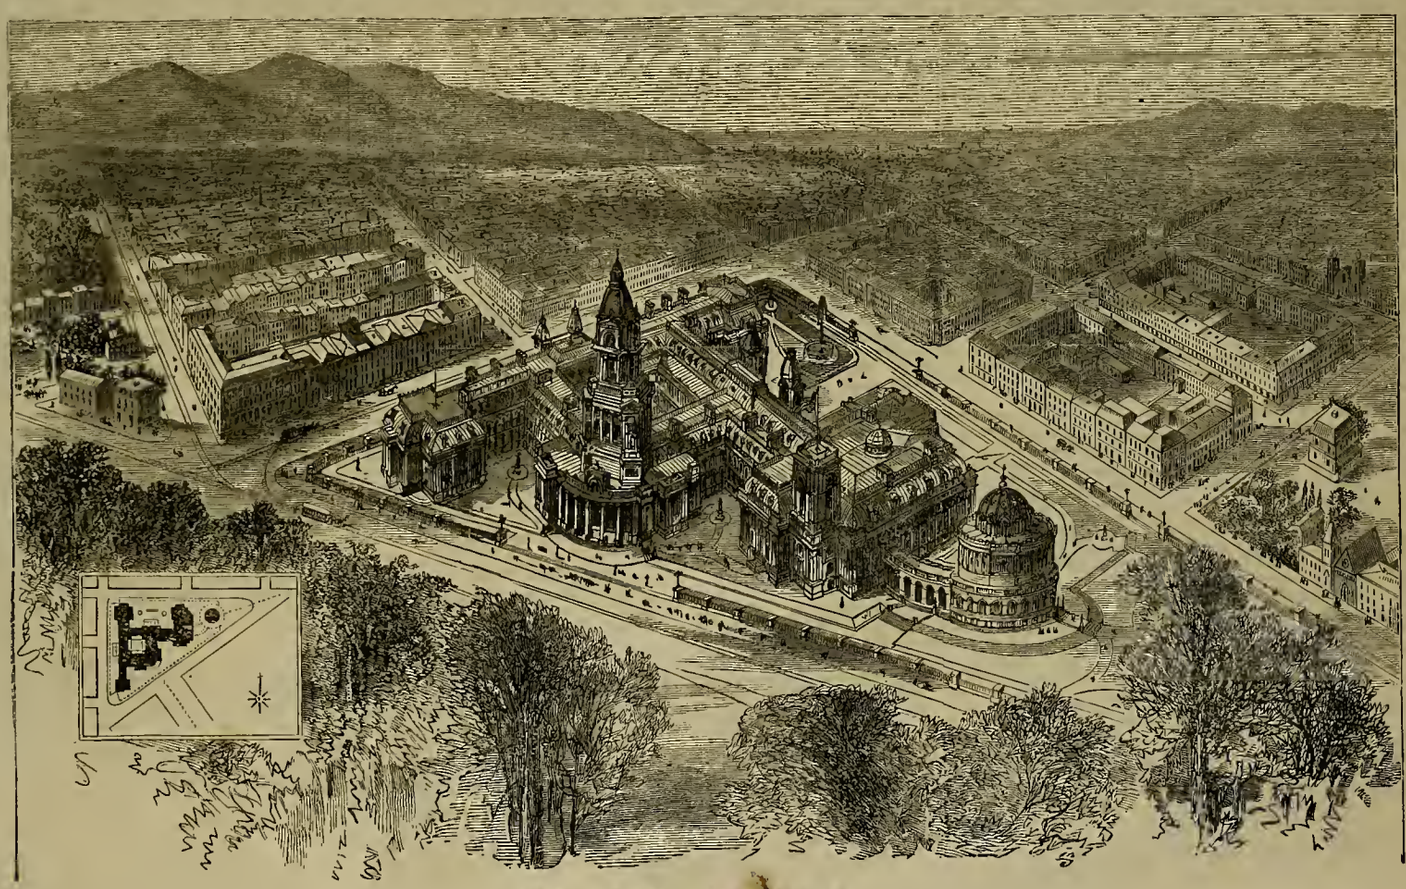
Warming

Every room and corridor with hot water and steam as may be required. A thorough system of ventilation can be secured by driving down through a shaft in the main tower and through flues in the walls or partitions, fresh air by means of fans or blowers, the vitiated air being taken off through extracting shafts in some of the flues or smaller towers.

The Foundation Stone

Was laid on Washington's Birthday 1871, in the presence of an immense crowd which included all our principal City and State dignitaries. Work was first commenced on the building by the laying of the concrete bed on the 13th of September, 1871. The stonework of the foundation was completed on the 17th of April last. The work is being carried on under the supervision of Messrs. R. H. Canavan, J. G. Eastland and C. E. McLane, the Commissioners appointed by the Legislature. Of these Mr. Canavan is Chairman, Mr. Robert George, Secretary, and Supervisor H. L. King is General Superintendent of the building, and Mr. R. Laver of Messrs. Fuller & Laver, New York, the architects who carried off the prize for design, is the supervising architect. The work when completed will be an honor to the munificence of this capital of the West, and will be an eternal monument to the genius and skill of the designers.

The work when completed will, of course, be a grand accomplishment; but as to the wisdom of such an immense outlay for such a purpose in the present period of the development of our young city there is, to say the least, a candid difference of opinion among our citizens.



NEW CITY HALL, SAN FRANCISCO.

MEN EMPLOYED IN MINING IN 1870. — Some industrious statistician has discovered that in 1870 the number of hands—men and boys — actually employed in mining operations, above and underground, in the United States and Territories, was 154,328. Of these 81,241 were employed in Pennsylvania mines, 7,589 in California mines, and 11,241 in the mines of Ohio—these being the three largest mining States in the Union. Next to California comes Illinois, and then Michigan. Of the $152,598,994 produced by the mines of the country that year, the Pennsylvania mines turned out $76,208,390, and the mines of California $8,281,633. The mines of Pennsylvania produced about $973 per head, and those of California a little over $1,000.

ABOUT 100 men are now employed upon the Hell Gate improvements. Six Burleigh drills, driven by compressed air, are working day and night, the diamond drills having been discarded, except for testing. On an average, 950 cubic yards of rock—the hardest gneiss, which is really preferable to a softer material, as it contains few seams and fissures to admit water—are removed monthly, by the use of about 1,000 lbs. of nitro-glycerine in eight ounce cartridges.

THERE are now fifteen narrow-gauge railways in operation in the United States, the lines comprising altogether 700 miles of track. The gauge of these roads is 3 ft., and one has been built and equipped at the rate of $17,500 per mile.

PENNSYLVANIA COAL.—For the year 1872-3 the deliveries of anthracite were 7,807,409 tons and of bituminous coal, 8,778,663, against 7,703,508 and 8,580,203 respectively for the year 1871-2.

"LIBERAL trade is good scholarship popularized; and commerce is literature on a sign board."

THE HOOSAC TUNNEL is nowhere less than 24 ft. wide nor less than 24 ft. high in the center.

CORRESPONDENCE.

The Vienna Exposition.

[By our Special Correspondent—GUIDO KUSTEL.]

Since my last letter a great many more articles have been exhibited in the American department, but nevertheless, the unpacking of goods still continues. The largest part of the space in the yard is taken up hy sewing machines from most of the prominent factories, exhibited in a very elegant style. The water pumps of Coving & Co., Duglas and Churchhill, New York, are also well represented, each one exhihiting a great number of pumps nicely arranged. There is also a good model of a United States Sanitary Commission Hospital car, showing the arrangement of heds inside.

Carriages and Buggies.

Jarven's patent wheels (for carriages and buggies) give some idea of how light a carriage may be if supported by such wheels. I examined the different carriages of France, Anstria, Hungary and Russia; they do not vary much in construction in the different styles; all are elegant and comfortable, but clnmsy—especially the Russian coaches. All are heavy, doubtlees corresponding with the strength of the material of which they are built; but those which should he light, as, for instance, hnnting and excursion carriages, cannot be compared with the American, for the simple reason that there are none here of the latter to compare with.

The American Geographical Society of New York exhibits a fine set of maps, about fifty-five in number, some of a large size, representing Hudeou River, Chesapeake Bay, Portland Harbor, San Francisco Peninsula, etc. The Northern Pacific Railroad Company makes a display of the products of the land belonging to that company. One can see wheat, barley, rye, corn, oats, fruit, vegetables, grass, minerals, woods, etc.; also, pamphlete, entitled, "Guide of the Northern Pacific Railroad Company's Lands in Minnesota." There is an immense map hung above thoee articles showing the railroad and lands belonging to it. The Company did all possible to attract the attention of those who are inclined to emigrate. The State of Alabama is represented hy a small collection of cotton in different phases, from Mobile, and two frames of butterflies and beetlee from there; iron ore, specimens of wood, bamhoo sticks from Lounder County, nicely finished, and in the natural state, eweet potatoes, etc. Both the gentlemen of Northern Pacific Railroad and Alahama in attendance have to answer many questions. California also probably wants emigrants, but where ie California? Where her Commissioners? Even that little contingent that came from there, representing the silk industry of California, is taken away, to serve the interests of Alabama. The California Commissioners may have done a great deal for their State, but it is not evident.

The American Exposition in Vienna

Is well arranged, offers a great many interesting objecte, hut when one thinks that it is a contrihntion of forty millions of people, whose industry occnpies the first rank, it presente a very unsatisfactory particination in the industrial combat of all civilized natione, and in view of thie fact, the exhibition of a large map of the city of Philidelphia, showing the spot of the world's exposition of 1876, marked by a good sized red star, with explanation in several langaugee, as an invitation for participation, seems to be improper. Much more satisfaction is fonnd in the American department in the machinery hall. There are in all 4,694 objects exhibited, contributed by different nations, in the following proportion: Austria, 1297; Germany, 1182; United states, 539; England, 496; Belgium, 289, France, 276; Switzerland, 164; Russia, 120; Hnngary, 198; Sweden, 43; Denmark, 46: Italy, 25; The Netherlande, 19.

Of the 539 American machines, there are five motore, 35 appertaining to metals, 24 to wood industry, three to textile industry, 450 miscellaneous, 22 for transportation, one street car. The agricultural machines are not included.

North of our "means of education" exhibition ie the Venezuela department; it occnpiee a limited space and is not yet ready. From here yon enter

The Brazilian Deparlment.

The most prominent expoeition of Brazilian producte is the coffee. This important article is richly repreeented by quite a number of different eorts, from Rio de Janeiro and other dis-ricte. Cotton is exhibited by several parties. There is a cotton grotto, very iugeniously arranged, giving a true idea of a stalactite cavern, fine wool and vegetable fibre, india-ruhber in the raw state, boots and shoes, leather, and leather articles of different decriptione, sugar, winee and liquors, silk and cocoons from Rio Grande de Sur; a large caee of arms of savages, consisting of arrows, spears, shields, wooden utensils; tobacco, chocolate and tea (the latter raised in the provinces of Rio de Janeiro, Miuas, Parana aud San Panto). There are several cases of minerals of not much interest, showing a number of quartz crystals, amethyst, calc and heavy spar specimens, lead ores, some gems of poor quality, coal, and some petrifactions. The exhibition of Brazilian woods is magnificent; there are over 300 specimens in all, the most polished on one side, so the texture and color can he examined. These woods are principally from the provinces of Rio de Janeiro, Santa Catharina, Pernamhuco and Parana. There is

One Case in This Deparlment

That absorhs the attention of all visitors, young and old, gentlemen and ladies. It is an exposition of different articles (all for sale) made of feathers and heetles. The splendid color of the plumage of the Brazilian birds and heetles gronped and made hy skillful hands into flowers, fans ear-rings and brooches, make quite fascinating articles. There is a number of elegant fans, with prices fixed to each at from $15 to $50, hut, although very dear, the most are already sold. There are imitated flowers so artfully made, that only hy a close examination one can perceive that leaves and flowers are composed entirely of feathers, with their natural colors. Another kind of flowers is made cf those little brilliant, gold-shining feathers, with which the throat and forehead of humming birds is so beautifully clothed. Several kinds of heetles, mostly of light green and hlue color, are framed in gold and used as ear-rings, etc. There are several piles of those beetles for sale from $2 to $4 per dozen. I was surprised to find a lot of $4 beetles of a greeuish-blue color, of which I could have gatherd thousands on the Rio Fuerte, Chihuahua. Skins of birds and a collection of large, beautifull hurter-flies, all sold, conclude thie iuteresting exhibition.

It is really very difficult to make a

Comparison of Arlicles of the Same Class

Between different natione, being ecattered and far apart. It is eo troublesome that one might say that it is impossihle. The arrangement of having as many groupes of one and the same kind of articles, as their are nations interested in the exposition, offers some advantage or rather comfort to the general superintendency; but, considering the object of a world's exposition, this reason should not he regarded at all. Doubtless this question will he coneidered carefully for onr Centennial Exposition in 1876, and a different principle adopted. The juries are now hard at work, and in a hurry. They have a "heap" of work on hand and little help from sourcee whence they have a right to expect it. I observed it iu onr department. A few days ago the jury of Group II came in and wanted explanation, but nohody wae there who had charge of that group. I tried to find somebody for them, but in vain, so the jury proceeded without information.

Metals and Minerals.

After an inquiry of three days I snceeeded in finding out that the jury of Group I would examine the minerals this morning. The jury came, not for the minerals, but for metals, and minerals relative to those metale. Again nobody to give account. Professor Richter is one of the jurors in this section. I went into the office, plenty of officere there, but not the right one. There are metallic nickel and cohalt and ore from Pennsylvania, exhibited by J. Wharton, of Philadelphia. The jury said they could not report on those metals unless they got a piece of each plate for analysis. Finally they left, without taking further notice of thie interesting exposition, and Mr. Wharton will be the eufferer. This don't look like business, hut on the other hand our officere are husy in measuring out the occupied space, in order to make out the bills for the exhibitors, and to my surprise and that of all the exhibitore, not only the space occupied, but aleo the walking space all round. This indirect doubling or trebling of the original tax in the progrmme will cause a row.

Railroad Cars.

Are exhibited by Germany, Austria, Hungary, Russia, Italy and Switzerland. Noue arrived from the United States, Englaud or France. Before the exposition was opened, it was expected that one or two Pullnan cars would be exhibited, hut to general regret, nothing of the kind was sent. The idea that a warm car in winter is more comfortable than one with a temperature of 10° seeme to be considerd now in Europe. The coupé eystem, so much in favor in Europe where eight persons are compelled to study each others physiognomy, whether they like it or not, is as useful in keeping up an approximately uniform temperature, as ie the case in the American oare. Opening the door coole down the small space in a most disagreeable way and for the same reason no stoves can be used. At present long oval tin or eheet iron boxes, filled with hot water keep the feet at least warm. There are some new systeme of heating exhibited, by direct heating of the air, aud also by pipes in which hot water is circulating. In either case there must he a fire place in the car. It ie not improbable that in course of time our comfortable and practical through paeeage cars will he introduced again here. A few sleeping cars, principally Auetriau, are also in the exposition, but they are not suitable for general nse and there is no comfort in them either. The picayunish economy of space requiree a proper ventilation which is not provided for, and, after all, they are constructed only for persons of high rank. This exhibition, perfect and iustruotive in many other respects, shows a new feature in the desire to do eomething also for travelers.

G. K.

Vienna, June 30.

Notes of Travel in White Pine County, Nevada.

[By Our Traveling Correspondent.]

The Towns.

The district of White Pine iucludes Hamilton, Treasure City, Eberhardt and Shermantown. Mines of more or less valne still surround each of these places; but as to the towns, some are known only by name, others contain but a small number of inhabitants. Shermantown has not over 25 inhabitauts, Eberhardt about 150, Treasure City, 300, and Hamilton abont 500. These include the entire population of

White Pine District.

While the district never was, or at least never seemed duller, the mines never looked better, nor had such an appearance of permanency as now; a little further on my opinions will be given for the assertion. In my letter of July 12th, I gave your readers the point of divergence from the C. P. R. R. to get here, also the time required and the cost of the trip. Hamilton is the county seat of White Pine county, and within a radius of ten or fifteen miles of that place lie all the mines of importance in this district. On the 27th of June last, Hamilton was almost entirely consumed hy fire. The losses were very large, considering the size of the place, yet not one-half of the first estimates. Ae near as I can learn, $250,000 will restore the place, barring the loss of time.

Treasure Hill

Is located about two miles south of Hamilton, and at an elevation above it of 1,020 feet, and is a little less than 10,000 feet above the sea-level. Water hoils at 185°, and the barometer stands at 21⅛ in fair weather. Treasure City is located a few hundred feet below the eummit of Treasure Hill, and at an elevation of 9,200 feet above tide-water, heing the highest town or city in North America. A great deal might be said about the climate, inhabitants, early settlement, etc.; but as the euhject has been worn threadbare, I will pass on to the development and preeent statue of the minee on Treaenre Hill.

The Original Hidden Treasure M. & M. Co.

This incorporation owns 800 feet of locatione on the extreme north end of Treasure Hill. Their 20-stamp mill (the Big Smoky) is lying idle, and they are working but 25 men, in both mine and tunnel. The work now being done in this mine is interesting to many, hut not so important as the

Wheeler Tunnel,

A work commenced by this company some two years ago, nnder the advice and management of the present Superintendent, Captain John Turner. It starts at a point on the O'Neil grade, on the east side of Treasure Hill, and 600 feet below the croppings. Thie tunnel hae been by different managements run into the hill about 500 feet, on a due west course, cutting the ledge matter at right anglee, 420 feet from the mouth, and rnnning iuto the west limestone rock at 500 feet, at the point where the ledge matter was cut. The present Superintendent has run south 200 feet on the vein, opening in one place a body of ore 15 feet thick. The work of running this tunnel will be continued in the direction of the west, or foot wall, to a point under the present vertical workinge; when they will cross-cut on the vein, and extract ore from the Wheeler tunnel. It ie now a eettled fact that they have the ore body at that point.

Silver Wave M. Co.

This incorporation hae a United States patent on 1,200 feet of ground, next adjoining the Hidden Treasure on the south. The company has what is known to be a fine mine, but for reasons beet known to itself, is now lying idle. Capt. John Turner is also Snperiutendent of this mine. Next adjoining, on the eouth of the Silver Wave, is the Edgar Mine, consieting of 300 feet of claims, and a part of the

Ward Beecher Cons. M. Co.

Theee, with the Ward Beecher North, consisting of 650 ft. of patented ground, constitute the above named incorporation. Capt. Turner is also Superintendent of this company. They are employing about 60 men and extract a snfficient quantity of ore to keep their mill (the Manhattan), of 24 stamps, steadily crushing, night and day. The mill is located about 1½ miles north of Hamilton and 4 miles from the mines, and is able to reduce 28 tons of ore per day of 24 houre. The rock ie transported by contract from the mine to the mill at $2.50 per ton. The mill is now dry crushing, having been altered, and has reduced an average of 800 tone monthly.

The Edgar Tunnel.

Starts at a point west of the center of that claim and about 150 feet below the croppinge of this mine, runs about 150 feet east on a level, passing through a variety of broken and disturbed calcareous matter and through the spar footwall. Here the ore body makes its appearance—low grade, but only 30 feet from the surface. Following the pitch of the foot-wall at this point an incline is sunk about 50 feet, dipping about 40°. From the foot of this, known as the 90 foot level, a drift is run 60 feet northerly, all in first class ore. There are also drifts to the south and 70 feet to the east, all in very fine ore, with no hanging wall visible. A vertical shaft is snnk 53 feet deeper, to the

One Hundred and Fifty ft. Level.

The shaft passes through the foot-wall and into the lime. The level is run eastward, striking the ore body at 39 feet, here twice the value of that of the upper levels. Some drifting, north and south, has been done, showing the foot-wall to be perfect and pitching at the same angle as before. The level has been drifted nearly 100 feet east, all in ore, and 100 feet in height explored show no hanging wall. This ore is now milling an average of $45 per ton. From these lines of development, I think it is almost conclusive that this is a regnlar

Contact Vein.

Although hut one wall is found, it is all that is necessary at the depth of their present workings. The pitch of the foot-wall and ore hody at this point is exactly on a line with that of the ore hody 500 feet below, in the Wheeler tunnel. As fine a prespect for a coutinuous body of ore for great depth as any I ever saw. The amount of ore now in sight and ready to be breasted out makes the Ward Beecher Cons. Mine a very valuahle one; hefore another year it will certainly be among the large dividend-paying mines. Next adjoining, on the south, is the

North Aurora Mine,

Owned hy the Eberhardt and Aurora M. Co., and at present the only ore of this company's miuee extracting ore. In my next I will give your readers eome additional particulars about this mine. I will now state, however, that they are employing about 100 men, day and night, and extracting good pay ore, which they are reducing at the South Aurora Mill at Eberhardt.

South Aurora Cons. M. Co. (Limited),

M. J. Goodfellow, Superinteudent. This company owns a mine of 800 feet, located ou Treasure Hill, and adjoiniug the North Aurora ou the south and the Eberhardt on the north. At present they are idle, bnt will soon start their diamond drill again in search of ore. In yeare past this was among the first of the hullion-producing mines. They own one of the best thirty stamp mille in the district, located at Eberhardt, Nev., ahout 2⅛ miles from the mine. It is now in active operation and running on ore from the Eberhardt and Aurora, employing 30 men regularly.

The Conover Bros'. Mine,

On Babylon Hill, about 1½ miles southwest from Hamiltou and about 2 milee west from Treasure City, is owned hy James L. and C. Conover. These gentlemen own, by original location, 1,000 ft. of a ledge running east and west, with a dip to the south. The croppinge are marked and distinct, standing above the country rock for a distance of over 500 ft. The country rock is limeetone. A tunnel has been run in 80 ft. Here a ehaft, following the incline of the ledge, hae been eunk to a depth of 30 ft., and at the bottom ie abont 50 ft. from the snrface.

The ore hody at all points thus far developed ie on both sides of a spar seam 4 ft. wide, and has a width of 4 ft. on either side. 15 tons of ore worked at Shermantown, milled $154.40 per ton, working to 92 per cent. aesay value. Assaye have giveu from $140 to $2,500 per ton. The ore mille freely; ite most important element ie silver, hut it contains also traces of gold, arsenic and antimony. At present the mine ie lying idle, but I underetand that some New York capitaliste are about to take hold and thoroughly develope it.

L. P. Mc.

Mint Operations for July.

The Mint operatione for the month are indicated ae follows:

Unparted gold bullion received in exchange from the Mint of the United States by San Francisco Assaying and Refining Works dnring Jnly, 1873:

	Ounces.	Value.
Gold	39,025,63	$717,324.46

Refined gold and silver deposited in United Stated Mint during July, 1873, hy San Francisco Assaying and Refining Works:

	Ounces.	Value.
Gold	70,147.06	$1,438,568.51
Silver	50,168.70	63,466.60
Gold deposited in Mint	70,1+7.06	$1,438,568.51
Gold sold in market	30,714.64	630,051.99
Total Product of Refinery	100,861.70	$2,068,620.50

Of the above fine silver, $60,000 was deposited for Trade Dollare. Of these, $43,000 have heen executed and go to China. There was also received from New York for China $15,000, Trade Dollars, which had heen coined in Philadelphia. Thie was probably better than to send the Mexican; hut if the silver had heen sold in New York and the Trade Dollars ordered made here from fine eilver, the cost of transportation would have beeu saved. As compared with last year the refining operations are ae follows:

	1872. Ounces.	1872. Value.	1873. Ounces.	1873. Value.
Fine Gold deposited in Mint,	51,612.21	$1,035,146.68	70,147.06	$1,438,568.51
Fine Gold sold in market,	59,773.91	$1,226,224.68	30,714.64	630,051 99
Standard Gold sold in market,	23,468.80	436,627.46	.....	.....
Product of Ref'y,	134,854.92	$2,697,998.82	100,861.70	$2,068,620.50

There has been an increase of coinage, and there is also some $300,000 left over iu the Mint that will come into next month's coinage. The quantity of gold sold in the market for shipment has considerably diminished.

MECHANICAL PROGRESS.

Important Information if Valid.

Views of a Practical Worker in Steel.

The opinion expressed recently by one of our best informed iron manufacturers, to the effect that the iron manufacturers and workers in iron and steel of the present day, instead of understanding the nature of iron and steel, really know comparatively but little about either, having only acquired as it were the alphabet of the business, is frequently corroborated in a practical way that leaves little room for debate.

The latest instance brought to our knowledge is embraced in the experience of a practical steel maker, who has expended forty years over the forge, and who, according to his own statement, worked in the traditional grooves trod by his predecessors, for many years, unquestioningly accepting the common theories of the craft, until accident afforded him an opportunity to examine into, and decide some things which led to a conclusion differing wholly from the commonly received opinions of his fellow-craftsmen. If his conclusions are correct (and every intelligent worker in steel can satisfy himself upon that point, and, at all events it would be well for steel workers to subject the theory to a fair test) very little care will secure to steel workers an immense saving.

According to our informant, in the language of the shop, when a piece of steal is overheatheated, and flies to pieces under the hammer, it is cast aside as worthless, the opinion obtaining that the life is burned out of it. This jargon of the shop is not unfamiliar to us. We hear it every day among iron workers. Our old steel worker informs us that experience has demonstrated to him the incorrectness of this conclusion, as commonly applied to steel. His statement will be regarded in some quarters as opposed to the recognized principle upon which the steel manufacturer bases his operations. In substance it amounts to this: That the heat ordinarily derived from a forge cannot, as an agency affect the character of the steel; that steel is not injured by overheating in the forge, and no absolute loss can ensue, save the low percentage lost in scales, as in the working of all hard metals.

Our old steel worker's mode of reasoning is so simple that we present it as we receive it from him. Beginning with the manufacture, he argues (what all will acknowledge) that no forge can produce a heat of half the intensity at which the metal is poured into the flasks. Where steel is subjected to intense heat in the forge, the moment the hammer strikes it, it parts, not because the principle is in any manner changed, but simply because it possesses less cohesive power. If, instead of throwing the steel thus easily broken aside, in the belief that it is ruined, the worker in steel will permit it to lie on his anvil until it falls to a lower temperature, he will find that he can do what he pleases with it; that it has not been in any way injured by the overheating. To prove this, it is only necessary to take up any of the pieces of steel thus cast aside as worthless, reheat them, and place them under the hammer, when it will be found that they can be drawn down precisely in the same manner as before the overheating process. Any workman employed at the numerous forges in this city, in making steel hammers, can satisfy himself upon this point in half an hour's time. Let him take up a fragment of the steel which, when he endeavored to punch the eye of the hammer, flew to pieces, reheat it, and see if he cannot work it as before. If he can do this, it follows then that the large percentage of waste growing out of "overheating" is, in effect inexcusable where the truth is known.

Our informant is James Patterson, of Brooklyn, at present in this city upon private business, and favorably known as an inventor. Mr. Patterson is convinced that a knowledge of the facts he sets forth will incure an immense saving to his old craftsmen, basing his calculations upon the average waste incurred under his own observation, and at the hands of workmen in his own employment at various times.—*Evening Telegraph.*

Deposits in Boiler Flues.

Professor Hayes gives in the *American Chemist* the following opinion regarding the formation of these deposits: "They are of two kinds, both of which are capable of corroding the iron rapidly, especially when the boilers are heated and in operation. The most common one consists of soot (nearly pure carbon) saturated with pyroligneous acid, and contains a large proportion of iron, if the deposit is an old one, or very little iron if it has been recently formed. The other has a basis of soot and fine coal-ashes (silicate of alumina) filled with sulphuric acids, and containing more or less iron, the quality depending on the age of the deposit.

"The pyroligneous deposits are always occasioned by want of judgment in kindling and managing the fires. The boilers being cold, the fires are generally started with wood, and when partially under way they are nearly extinguished (smothered) with large charges of coal or wood, pyroligneous acid then distils over into the tubes, and, collecting with the soot already there from the first kindling fires, forms the nucleus for the deposits, which soon become permanent and more dangerous every time wood is used in the fire-places afterwards.

"The sulphur-acid deposits derive their acids from the coals used, but the basis material, holding these acids, is at first occasioned by cleaning or shaking the grates, soon after adding fresh charges of coal. Fine ashes are thus driven into the flues at the opportune moment for them to become absorbents for the sulphur compounds distilling from the coals, and the corrosion of the iron follows rapidly after the formation of these deposits."

Measurement and Loss of Power—Improvement in Journal-Boxes.

One of the most important features of modern science is the precision with which we are enabled to subject to exact measurement those subtle forces which in a former age entirely escaped the grasp of the mathematician. Not only can we give in exact figures the precise quantitative value of the power exerted by mechanical agents, but even those etherial forces which in former times were considered "imponderable" and "immensurable" can now be subjected to the balance and the measuring instrument. The energy developed by a flash of lightning can be expressed in numbers quite as readily as can the acres in a field, or the tons in a block of granite, and the power developed by any of our modern motors can be measured and expressed as easily as can the number of yards in a piece of broad-cloth, or the number of pounds in a bar of iron.

This accuracy and precision is not, however, a thing of mere theory, nor is it a mere refinement of science without practical value in the affairs of the workshop. It enables us to subject to the closest scrutiny the different parts of our mechanical arrangements, and points out precisely where power is lost and wasted. It enables us to form clear ideas of the enormous loss which occurs in the ordinary steam-engine—a loss amounting to 90 per cent. of the total energy involved; and it gives us the means of expressing in definite terms the further loss which occurs in all machinery from the influence of that subtle destroyer of power—friction. As a practical result, we find that the attention of our best mechanics and engineers is being more directed to the *saving* of power; that is, to the prevention of loss. The character of our lubricators; of the material and finish of our journals; the form and weight of our shafting and gearing, and the construction of our journal-boxes, are all being subjected to rigid scrutiny, in the hope of devising means whereby the extravagant loss which now occurs may be lessened.

Amongst the numerous devices for lessening the friction incident to machinery in motion, is improvement in the journal-box. In the common form of box, where the journal is firmly held between two semi-circular blocks tightly screwed down, or by a moveable cap similarly held in place, the pressure is *wholly in one line*, and the result is that in a short time the journal works loose, from the fact that the hole in which it runs becomes oblong, instead of truly circular, and the result is a continual vibration, which soon proves destructive to the machinery.

But a Mr. Ellis, of Jersey City, has recently devised an improvement by which the pressure can be most accurately adjusted and maintained. Instead of the usual single cap, two *hunters*, as they are called, are employed. These hunters are made so that each covers a little less than one-quarter of the circumference of the journal, and are brought to their bearings and held there by screws passing through slots whereby they are made adjustable. By this arrangement the pressure is in two lines instead of one, by which arrangement the opening in which the journal runs cannot wear oblong; but must retain its circular shape—the pressure and wear being distributed into four points.

It is said that experience has fully shown that this mode of holding the shaft in place is far superior to the old system, and that there is little or no vibration, and, consequently, the bearings last much longer, while the quality of the work that is turned out is surprisingly improved.

THE NEW METAL INDIUM.—The last number of the *Revue Scientifique*, contains the first complete description ever published. of the new metal Indium, discovered by Dr. Reed. Like thalium, it was first revealed by its spectrum, which consists of two bright indigo bands, the more brilliant of the two being a little more refrangible than that of strontium, the other a trifle less than that of potassium. It is found in one or two varieties of wolfram, and in zinc and its ore, in exceedingly small quantities—the zinc of Freiburg, Germany, in which it was first observed, containing not more than one part in two thousand. When zinc is dissolved in sulphuric acid, the new metal remains in the spongy residuum. To obtain it, dissolve this residuum in nitric acid, and treat it with ammonia and carbonate of barytes, when the hydrate of indium is precipitated. This indium sponge may then be melted with cysnide of potassium, resulting in a whitish metal, which, after a while, assumes the tint of bismuth, and gradually loses its color so as to resemble lead. It has a density of 7.4, melts at 176 centigrade, burns at a red heat, and emits hydrogen when dissolved in sulphuric acid.

COAL OIL FOR LOCOMOTIVES IN RUSSIA.—According to Van Nostrand's Magazine, the Russians are experimenting quite successfully in the use of crude coal oil for steam generation with locomotives.

SCIENTIFIC PROGRESS.

Outlines of Mountains.

In an article in *Silliman's Journal*, Professor Joseph Le Conte discusses the causes of the difference in outline as follows: "The great bulge of the earth's crust which constitutes a mountain chain is doubtless produced by general causes affecting the whole earth, probably by shrinkage of the interior more than the exterior, by which the face of the old earth becomes wrinkled; but the smaller inequalities are almost always produced entirely by erosion. How any one who has ever been among the high Sierras can for a moment doubt this fact, I cannot understand. Standing amongst these mountains, all that constitutes scenery, every peak, ridge or dome, every valley or cañon, is evidently due to this cause alone, except in those parts where recent volcanic action has taken place.

"Now the forms produced by erosion depend partly upon the kind of rock, and partly upon the kind of erosion. The forms determined by water are different from those determined by ice. Standing in the middle of the San Joaquin plains, on a clear day, the crests of the Sierras are seen on one side and of the Coast range on the other. Nothing can be more striking than the contrast between the two—the sharp saw-like, teeth-like outlines of the former and the rounded outlines of the latter. The reason is, that the one has been determined by the action of snow and frost—the other by water only. The contrast is still more conspicuous when we are among the summits. In all the region where perpetual snow still lingers, the Sierras are studded with peaks and spires and comb-like ridges—so sharp that they seem ready to fall over, and especially with great amphitheaters bounded on several sides by almost perpendicular palisade-like walls with sharp serrated edges. These great amphitheaters are the wombs of the ancient glaciers and are still filled with snow.

"Such is the contrast in the summits. On the higher slopes it is equally striking. During the period of the ice-sheet, probably all the Sierra slopes, even to the summits themselves, were covered with rounded forms on a grand scale. Subsequent action of ice and snow and frost and rivers have destroyed these except in some localities. Water tends to form deep V-shaped cañons, while ice produces broad valleys with lakes and meadows. A camping party in the Sierras is made painfully aware of having passed beyond the limits of ancient glaciers by the sudden and entire disappearance of meadows, and therefore of grazing for horses. I know not how general these distinctions may be, but certainly the coast-range of California is characterized by rounded summits and ridges, and deep V-shaped cañons, while the high Sierras are characterized, on the contrary, by sharp, comb-like summits and broad valleys. And this difference, I am convinced, is due in part at least to the action of water on the one hand and of ice on the other."

SUGAR A TEST FOR POTABLE WATER.—From an article on "The Discrimination of Good Water and Wholesome Food," in the *Pharmaceutical Journal and Transactions*, we take the following simple directions given for testing water, whether it is good and drinkable. "Good water should be free from color, unpleasant odor and taste, and should quickly afford a good lather with a small proportion of soap. If half a pint of the water be placed in a perfectly clean, colorless, glass-stoppered bottle, a few grains of the best white lump-sugar added, and the bottle freely exposed to the daylight in the window of a warm room, the liquid should not become turbid, even after exposure for a week or ten days. If the water becomes turbid, it is open to grave suspicion of sewage contamination; but, if it remains clear, it is almost certainly safe. We owe to Heisch, this simple, valuable, but hitherto strangely neglected test."

A NEW EXPERIMENT.—It has been found that tinfoil, if wrapped about a few crystals of chlorate of potassa, can be made to detonate loudly upon being struck smartly with a hammer upon an anvil, or in a mortar, the phenomenon being precisely analogous to the well-known experiment of triturating sulphur and the chlorate. To the best of our knowledge the observation that such metals as tin can be oxidized in this way is a new one and worthy of notice.

OZONE BY SLOW OXIDATION. — If a small quantity of benzine be placed in a large vessel and exposed to direct sunlight for a few days in summer, the vessel being frequently opened and shaken, the air in the vessel will contain ozone. The same change will take place in diffused daylight, or even in the dark and at a low temperature, but a much longer time is required.

THE METALS OF THE SUN. — The latest researches by many distinguished physicists have shown that the following terrestrial elements are present in the vaporous condition round the sun: sodium; calcium; barium; magnesium; iron; chromium; nickel; copper; zinc; cadmium; cobalt; hydrogen; manganese; aluminum; titanium—fifteen in number.

Chemical Prizes Offered in France.

The Society for the encouragement of Industry in Paris offers the following prizes for 1873:

	Francs.
Economical preparation of oxygen	2,000
Economical preparation of ozone	3,000
Combination of the nitrogen of the air to produce cyanides	2,000
For a new and useful alloy	1,000
Writing ink that does not corrode metallic pens	1,000
Permanent disinfectant for water closets	6,000
Manufacture of graphite for pencils	3,000
Synthesis of a useful organic product, quinine, alizarine, sugar, etc	4,000
The theory of steel founded upon actual experiments	6,000
Application of endosmose to liquids	1,000
Application of endosmose to gases	1,000
Filters for drinking water	1,000
Improvement in agricultural machines	1,000

There is something very suggestive in such a list as the above. Although nearly a hundred years have elapsed since Priestley announced the discovery of what is now known as oxygen gas, and although chemists agree in saying that one-half, if not two-thirds, of the actual weight of the world is made up of this gas, we find the tacit admission implied in the large prize offered for 1873, that even at the present time we have no cheap and economical method for the preparation of oxygen. Many methods have been proposed and many tried, but the conviction still obtains that the problem has not yet been solved. So, also, with the use of the nitrogen of the atmosphere for manufacturing purposes. For the production of Prussian blue, we obtain our nitrogen from animal matter; why not from the air? It is believed that ozone is capable of extensive use in the arts, could we make it cheaply, hence the offer of a prize relating to it.

The whole list is instructive, and ought to set our inventors and chemists at work to solve some of the questions raised.—*Ex.*

A NEW RELATION BETWEEN ELECTRICITY AND HEAT.—Dr. Guthrie, in a paper read before the Royal Society of London, gives the results of his study of a new and possibly important relation between electricity and heat. He finds that when an electrified insulated body is presented to a heated body (especially when the latter is in communication with the earth), the latter has the power of completely discharging the former of its electricity. The discharging power of a heated body diminishes with distance and increases with its temperature, and specially depends upon the heat rays of high intensity. The discharging power of a small white-hot platinum wire exceeds that of a large cannon-ball heated to the temperature of boiling water. This power does not depend upon the temperature of the electrified body. Negative electricity is always discharged more easily than positive, but the difference in this respect diminishes (with certain variations) as the temperature increases. Similar effects are obtained whether we use galvanic or static electricity. As hot iron discharges electricity most easily, so on the other hand, a ball of white-hot iron refuses to be charged. As the white-hot ball cools it becomes first possible to charge it with negative, and subsequently, as it grows cooler, with positive electricity.

THE VARIABLE SIZE OF THE SUN. — Secchi, the astronomer of Rome, has concluded from certain observations made during the past year, that he is justified in affirming that there is a periodic variability in the size of the sun. The many startling revelations of science during the past ten years have prepared the way for acceptance of even this conclusion, though the observations on which Secchi founds his belief are as yet so few as to still leave room for some possible doubt on the subject. It would seem that the outer surface of the sun—the photosphere as seen by us—is a gaseous envelope in a state of continual and perhaps periodic change, such that the diameter of the solar orb, as measured by the aid of the telescope, is least in the region of the greatest spot activity—that is, the solar equatorial bolt does not bulge out as does that of the earth, but, on the contrary, the solar polar axis is the longest diameter of that body. The excess of the polar over the equatorial diameter is, however, a very small quantity, and may be referred either to tides in the photosphere or to the influence of the solar spots themselves.

THALLIUM FROM VESUVIUS.—Professor Palmieri has made many spectroscopic analyses of the sublimations of the fumeroles, or small holes on the crust of the volcano of Vesuvius through which vapores escape, and finds the metal thallium in most of them. Thallium is the new metal discovered in 1861 by Dr. Crookes. In weight and appearance, it resembles lead. When burned in oxygen it yields a splendid green flame, and its chlorate, it is supposed, might be used in fireworks to advantage. Thallium is found in various mineral waters; its sulphate is very soluble in water.

COMBUSTION OF THE DIAMOND.—An experiment lately made by Mr. Spence, of Manchester, seems to prove that under certain conditions the diamond is combustible at a much lower temperature than has been hitherto supposed. A South African diamond of the size of a pea, coated with refractory clay, was placed in a crucible with a mixture of soda and hydrate of lime, and then heated in a muffle for three days and three nights. On opening the mass, it was found that the diamond had entirely disappeared, although the heat had never exceeded a cherry-red.

Weekly Variations in Stocks.

[Based on Regular Sales of all Stocks in the San Francisco Stock and Exchange Board.]

For 6 days ending Wednesday, Aug. 6, 1873.

Our Weekly Stock Review.

THURSDAY EVE., Aug 7, 1873.

The Stock Market tbis week has been in a very depressed condition; prices bave been weak and tbe volume of business llgbt. A slight reaction set in last week, but there was not mucb excitement, and on Tuesday the market began to droop again. Nobody seems disposed to invest in stocks just at present, though tbere is little apparent reason for it, otber than the general business depression. Tbe late long-continued and still existing dullness was to have been anticipated, to some extent, as tbe months of July and August are usually the low tide of the year in the stock market.

Sales at the San Francisco Stock Board amounted to $2,172,000 for the week. The number of shares sold of the more active stocks was as follows: Newark, 15,400; Imperial, 9,100; Belcher and Meadow Valley over 7,000; Baltimore Consolidated, Caledonia, Gould & Curry and Savage over 4,000 each; Eureka Con., Huhn & Hunt, Minnesota, Raymond & Ely and Washington & Creole over 3,000 shares each.

The reports from the Comstocks are as good as ever, but the actual production of bullion is less than usual, on account of the lowness of water in the Carson River, where tbe mills are. The production of bullion is nevertbeless larger than it was last year, when the water was lower, the Crown Point, disabled by a cave, and, further on, all the mines partially stopped by the fire in tbe railroad tunnel.

The only dividends announced thus far for August are as follows: Minnesota, $1.50 per share, aggregating $30,000; Eureka, (Grass Valley,) $1, aggregating $20,000; Belcher, $7 per share, or $728,000 in all. The dividend of tbe Minnesota is the first ever paid. It is an Idaho mine and levied an assessment in January. The Crown Point ore product for July was 10,172 tons; valued at 65 per cent. of assay, $627,770.97; average, $61.71. Several other mines will probably announce their dividends for the month next week.

On Friday the stock market was weak and low with a light business. A few stocks however showed a slight advance. Belcher went up $2; Challar $1; Savage $2 Golden Chariot $3; and Minnesota $2.

On Saturday some little improvement was manifest and prices rose to some extent. At close Belcher went up $1; Crown Point $1; Challar $1; Savage $4; S g. Belcher $3; Hale & Norcross $1; Opbir $1; Overman $1. Raymond & Ely, which was $74 before the Board, sold down to $69 and was $68 after the Board. Hermes sold $4.75; Kentucky $2.75; Minnesota declined $2.50.

On Monday the market was better than usual on that day of tbe week, but still signs of weakness were apparent. Crown Point was $3 better than on Saturday; Hale & Norcross, $2; Baltimore Con., 50 cents. Raymond & Ely fell $1; Newark, $1; Eureka Con., $1.

On Tuesday the market was considerably stronger, but the amount of business was small. At the afternoon Board a general decline was evident.

On Wednesday there was no change in the Stock Market, and prices closed even lower than on the previous day.

To-day there is little change to note. From yesterday morning's quotations Crown Point has advanced $2, Belcher $1.50, Gould & Curry, Raymond & Ely and Yellow Jacket $1 each; Sierra Nevada is $1 lower, and Overman and Seg. Belcher each $2 since yesterday.

OSCILLATION OF SUN SPOTS.—It has been found that during periods of great solar disturbance there is a tendency in the spots to change from one hemisphere to the other, the translation occupying about twenty-five days. No such systematic movements were noticed in times of comparative quiet. The cause of this strange phenomenon is as yet unknown.

THE COAL MINE on Black River, 10 miles from Seattle, is spoken of as exceeding, for quantity, quality and facility of access, any thing of the kind yet developed upon the Pacific Coast, and even the mines in the famous coal regions of Pennsylvania and Virginia.

NEW METHOD OF PROTECTING THE PLATES OF IRON SHIPS FROM CORROSION.—To prevent the corrosive action of bilge water upon the iron plates of iron ships, James Young has suggested and tried the use of lime, to neutralize the acid of the water. Actual experiment, continued for several months, shows that a small quantity of lime in the bilge water wholly prevents the corrosion of the iron plates.

THE OVERMAN COMPANY have gained a dismissal of the appeal by the Dardanelles Company from the Land Office of Nevada. The dismissal decides that the protest filed by the Overman before the Register is good.

BULLION.—On the 3d inst. Wells, Fargo & Co. shipped from Winnemucca 4 bars of Minnesota bullion, worth $16,152; it came to this city. They forwarded to New York three bars of Golden Chariot bullion worth $6,754.

THE Lancanshire miners of Wigand District are on a strike for an advance of wages and reduction of hours.

A RICH QUARTZ discovery has been made on Deadwood Ravine, near Forbes' Town, Butte county.

THIRTY TRAINS per day are now running over the Virginia and Truckee Railroad.

ANOTHER strike, is reported in the Mono mine, Utah.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

California.

AMADOR COUNTY.

Silver Ore.—Amador *Ledger*, Aug. 2: Mr. John S. Campbell left at this office on Wednesday, several pieces of metal-bearing rock, resembling in external appearance specimens of silver ores from the Virginia mines. Mr. Campbell informs us, in sinking a well on his premises, at the depth of thirty feet he came upon a body of ore, (of the kind brought to the office) about 5 ft. in width, the entire body being entirely charged with sulphurets, and as far as sunk upon, having all the appearance of a well defined and permanent lode of metal-bearing rock. From the general appearance of the rock left by Mr. Campbell we are satisfied that it is silver-bearing, but of what value, we have no means of knowing. The deposit is about one and a half miles southeast of Jackson, and its value should be fully tested.

The Alpine Mine.—This mine, located at Plymouth, we are informed is turning out very fine rock, with most flattering indications of continuing. We have no doubt of the ultimate success of this mine, situated within the great gold-bearing belt of the county; its present development gives flattering promise of future returns.

Quartz Lode in Jackson.—Mr. Danl. Hertee, in sinking a well near his machine shop on Broadway, at the depth of ten or twelve feet, came upon a well defined ledge of quartz rock, about three feet in thickness, having all the indications of a regular ledge, with walls and gangue peculiar to the mines in the vicinity. The rock not only shows gold-bearing sulphurets, but also free gold visible to the eye. The rock as far as taken from the well, bears a striking resemblance to the Kennedy rock. This discovery may yet prove of value.

Kennedy Mine.—The main shaft on this mine is now down 700 ft., and connected with the old shaft; the mine is looking remarkably well, the ledge well defined and the rock abundant, and well charged with free gold and gold-bearing sulphurets; at no time in the history of this mine, has it ever presented a more flattering appearance than at the present. The Kennedy, with its present development, may be safely recorded as one of the valuable and permanent mines of the county.

Amador Canal.—As far as we can learn, our quartz mines are looking as favorably as at any former period, and the gold yield satisfactory. In placer mining but little activity prevails except in the vicinities of Volcano and Aqueduct City. The Amador Canal in that section of country is furnishing water to all who require it on accommodating terms, and will be able to do so through Summer. There is a large scope of country within reach of the waters of the above named canal that ought to be developed, and for that purpose miners should avail themselves of the present supply to unlock the golden treasures hidden away beneath the hills and flats of that section of our mines.

CALAVERAS COUNTY.

Railroad Flat District.—Calaveras *Chronicle*, Aug. 2: The new pump of the Sanderson mine is in position. Sinking will be resumed as soon as the Superintendent can find miners for that purpose. A contract has been let to sink the Prussian Hill mine 100 ft. deeper at $16 per ft. The old portable engine of the Sanderson is being used for hoisting purposes to complete the contract. The Essex, E. Beals, Superintendent, is working two shifts in the tunnel. The fissure is very large and well defined, containing highly mineralized vein matter. A new shaft has been commenced on the old rich chimney of the Herzer mine. Clark's ponderous hydraulic is still thundering in the Flat, but the scarcity of water will soon suspend operations for this season. Many of the mine owners of this district, West Point and Mosquito, are complaining for the want of a necessary force of miners. Competent under-ground miners are very scarce.

Coal.—We are informed by Mr. Mathew Murray, of Lancha Plana, one of the proprietors of the recently-discovered coal mines in that vicinity, that operations are progressing and that very favorable developments are being made. A much better article of coal is now being obtained than heretofore, and it improves in quality as the tunnel is being driven ahead. Mr. Murray has promised to send us some specimens. When we receive them we shall be able to speak more definitely in regard to their quality.

EL DORADO COUNTY.

Taylor Mine.—Mountain *Democrat*, August 2: This mine is situated near Greenwood on the line of the St. Lawrence and Stiger ledge. For some time until quite recently, work has been suspended, but has lately been resumed with flattering results. Some time was consumed in cleaning out the shaft and fitting up. A depth of two hundred feet has now been reached, from which point we are in receipt of samples of rock that make a liberal showing of free gold and is full of good looking sulphurets. A battery of 5 stamps was set in motion at the Taylor mine last Wednesday. The cams and shafts are in position and the mortars and stamps for 5 more have been ordered. The Superintendent, N. D. Burlingham, who is one of the most experienced and efficient miners in the country, is quite confident that the Taylor will soon rival the St. Lawrence and Stiger.

INYO COUNTY.

Shut Down.—Inyo *Independent*, July 26: Our Cerro Gordo correspondent informs us that it is probable both the Belshaw and Beandry furnaces will be compelled to shut down for a time. It is scarcely possible to obtain either water or men to run them until a supply of the former is obtained through the new water company, who are actively engaged in their work. Many of the furnace hands and miners are unable to work through sickness, more prevalent than usual while the weather is so extremely warm, and are going off to the fishing grounds and elsewhere to recuperate. Among others, Mr. Beandry and his Superintendent, Mr. Porter, are obliged to repair to the coast for relief, both having long been in very bad health. Money is scarce, and, pending a final decision of the great mining suit, is not likely to be more plentiful—so, we presume, it will not justify to be at such a continual heavy expense in adding to those immense piles of bullion now awaiting shipment, and, of course, paying no returns to the owners. In other respects the prospects of the camp were never more encouraging. The other important mining enterprises are going on there, with the certainty of an abundant supply of water early this fall, together with the active working of the Swansea Company, will do much toward maintaining the usual financial balance of the county.

A cinnibar lode has been discovered in Humboldt county Cal., about 20 miles from Yreka. It is said to be rich.

The Cottonwood Flume.—Inyo *Independent*, August 2: Is progressing finely. Last week about one mile of the flume, from the head, had been laid. This is over the heaviest incline and the ruggedest portion of the entire route. As fast as completed in short sections the flume is used in sending down material for the next succeeding, and thus its efficacy is being tested at every step. In this essential point it is a success in every respect, and Colonel Stevens is delighted accordingly. The sawmill, at the head of the flume, besides the main saw, is fitted with an Edgar and cross-cut, used in preparing flume timbers, and altogether is considered the best mill in the county. An accident occurred a short time since, which will delay its work a short time. This was by twisting off the shaft of the turbine, which has to go to San Francisco for repairs. There is enough lumber already out, however, to keep the work going ahead on the flume until the wheel is in place again.

Lida Valley.—Times are very quiet in Lida Valley since Hiskey & Walker's mill shut down. This result was caused, not by any failure of the mines or mill, but by the San Francisco firm, Parker Watson & Co., whose property, including an interest in this mill, is under attachment, hence the stoppage. It is thought an early arrangement can be effected so that the mill and work will soon start up again, a consummation most ardently desired in that region.

Still Running.—Notwithstanding the report to the contrary, which by the way, was based on good authority, both the Cerro Gordo furnaces will continue in operation. At least Beaudry's is now while Belshaw's is undergoing repairs, no doubt with a view of a steady run. The Swansea furnace is and has been running steadily, except a few days in the beginning of last month, when work was suspended to rebuild.

Nevada.

CHERRY CREEK DISTRICT.

Ploche *Record*, July 25: There is but one mine being worked to any considerable extent, and that is the Exchequer mine, which has been bonded to Hoffman and his associates, who express great confidence in its future value and permanency. There are several other mines in the district which show good ore in limited quantities but the owners prefer to hold them in wait for purchasers to enter upon active development. Purchasers, however, are not easily found nowadays for mining property where only a surface showing can be made. There is no lack of mill facilities for working the ore of the district should it be found in quantities, as Cherry Creek is only about three miles north of the old Egan District, where there are two mills now lying idle.

Remorse Consolidation.—It was rumored on the streets yesterday that a consolidation had taken place between the Hermes, Ploche-Phenix and Kentucky mines, by their respective companies, at San Francisco. It was also stated that the consolidation had destroyed all prospects of a compromise between the Raymond & Ely and Hermes companies, and the new trial granted in the District Court would be hurried up now with all possible speed. If there is to be another trial, this prayer of the camp is that it be had as speedily as possible, as the doubt and uncertainty in which we are involved have all the agonies of a lingering death for the business interests of the place.

The Crown Point Mine.—The *News* of July 26th, gives the present condition of the mine as follows: "The daily yield of ore is 450 tons. The main south drift on the 1,400-ft. level is making steady progress, the face in porphyry. The flow of water from the east cross-cut from this drift has somewhat decreased, and another cross-cut, sixty feet further south, has been started to assist in draining the water: Both the north and middle winzes on the 1,300-ft level continue in rich ore. The winze from the 1,200-ft. is looking finely.

Ore breasts throughout the mine are all looking and yielding splendidly, and the prospects of rich returns to the shareholders have never been more flattering than at present.

No. 7 Shaft, of the Meadow Valley company is now bringing to the surface some very rich ore, which they have just commenced sending to their mills. There are about 100 tons of this ore now on the dump.

Utah Mine.—The shaft of this mine is now down to the depth of 240 ft., and sinking is progressing at the rate of 20 inches per day. This is excellent progress considering the large size of the shaft and the fact that but three men are working on a shift. The little old pump is still in use, but is not capable of raising the water to a much greater height, and preparations are now being made for putting in a new pump The column of the new pump will be eight inches in diameter and it will be sufficiently large to handle all the water likely to be encountered in a long time. A portion of the machinery for this new pump is now on the ground. It is expected that the shaft will cut the east clay of the lead at the depth of 500 ft. The lead lies very flat where it was cut by the old shaft. The width of vein matter shown by the old works was 80 ft., with an east clay wall 12 ft. thick. Some good ore was found in the old works, but it was in bunches and streaks and was in no place found to be sufficiently concentrated to form a workable deposit.

Territorial Enterprise, July 27: Items.—The Sierra Nevada Company are going along on the even tenor of their way; extracting and crushing 60 tons of ore per day.

Belcher Bullion.—There were yesterday received at the Bank of California 16 bars of Belcher bullion, worth $59,000.

The Occidental mine is yielding 35 tons of ore per day, which is being worked at the mill of the Company.

The Chollar-Potosi mine is yielding 150 tons of ore per day, worth, according to assay, $30 per ton.

The Daney Company have struck a small quantity of water in their new shaft, at a depth of 160 ft.

The silver Hill Company are taking out 60 tons of ore per day, which is worked at the Bacon mill.

WASHOE.

Belcher.—Gold Hill *News*, Aug. 2: Daily yield 450 tons of ore, averaging $65 per ton. All the stopes on the different levels are looking and yielding finely. The ore stopes on both the 1200 and 1300-ft. levels show a decided improvement going south, the ore being all of high grade. The main south drift on the 1300-ft. level is in 303 ft. and still in good ore. The winze on the 1200-ft. level, 100 ft. south of the Crown Point line on the east side of the vein is down 14 feet in splendid ore. The heat on the 1000-ft. level is very great. The general appearance of the south portion of the mine leads to the belief that the ore body is of much greater magnitude than was hoped for, taking the upper level as a standard. The company is prepared to greatly increase the quantity of ore extracted from the mine, but owing to the scarcity of water in the Carson river, cannot get it crushed.

New York Con.—The water continues to increase in the bottom of the shaft, and requires the hoisting of 18 tanks an hour to keep it down sufficiently to permit of the prosecution of the work.

Gould and Curry.—The main northeast drift on the 1500-ft. level is still driven ahead, the face in quartz of a very promising nature. The east cross-cut in the main south drift on the 1000-ft. level has cut through a heavy clay wall into a body of quartz that gives excellent promise of some good ore developments soon. The ore-breasts on the second level continue to yield from 10 to 20 tons of low-grade ore per day, and a drift has been started 100 ft. lower down to prospect the ore body at a greater depth.

Consolidated Virginia.—Sinking the shaft is making excellent progress, the rock in the bottom blasting finely. The flow of water from the face of the main north drift on the 1,157-ft. level, from the Gould and Curry shaft, continues unabated, and no progress whatever has been made since our last report. The erection of the new hoisting and pumping machinery is fast approaching completion.

Caledonia.—The north winze from the 400 ft. level, will make the connection with the main north drift on the 500-ft. level in a very few days more, giving a much needed circulation of pure air, and greately facilitating the prospecting and extraction of ore on the level. The prospecte of the development of a fine body of good ore by the north drift, on the 500-ft. level, are steadily increasing as the work progresses. The Sapphire mill is kept steadily running on ore from the mins.

Silver Hill.—The main northwest drift at the second station is still driven ahead, the rock in the face working finely, with a slight increase of water. The main north drift at the first station has been driven until near the Justice line, the face still in good ore. Daily yield 60 tons of ore, mostly from the ore breast in the north drift at the first stetion. The Bacon mill is kept steadily running on ore from the mine.

Daney.—The shaft is down 155 ft., the water from the bottom steadily increasing as greater depth is attained. Excavating and preparing to put in the pumping machinery has been commenced, and will be prosecuted with the utmost vigor until completed.

Lady Washington.—The steam pipes have been connected with the boilers, the furnaces are ready to fire up, and the new hoisting works will be in full blast in a day or two more. Everything in and about the works has been done in the most permanent and complete manner, good developments may be looked for.

Crown Point.—Extracting ore from the 10, 12 and 1300-ft. levels. Two winzes have been started from the 1300 track floor to connect with the 1400-ft. south drift. The north winze, which is down 22 ft. on an incline of 34 deg., is now in good ore, and has been from the start. Ore of excellent quality has been encountered in the next winze, which is designated as the middle one, owing to the fact that another one will shortly be started on the south line. The various floors and breasts throughout the 1300-ft. level are looking exceedingly well. The Atlas, Potaluma and Pioneer mills, which have been undergoing repairs for several weeks past, will start up next Monday on Crown Point ore.

Tyler.—The shaft is down 135 ft., at which depth a heavy flow of water was struck, which has necessitated the suspending of operations until new pumping machinery, which is now on its way, shall arrive from San Francisco. This machinery is expected to arrive this evening, when it will be immediately erected, and work in the shaft resumed in a very short time.

Overman.—The main west drift at the 1000-ft. level is still driven ahead, with no change to note except a slight increase of water from the face. The main prospecting drift south is making good progress. There is no change of interest in the main northwest drift. The shaft is nearly drained, so that sinking can be again resumed whenever the Company see fit to do so.

Occidental.—Daily yield, 40 tons of ore. The ore breasts are looking well, and the mine premises a profitable, permanent investment and steady return for many months to come for the labor and money invested. There is a good supply of ore accumulated at the mill, and the yield from the mine can be greatly increased whenever the management see fit to do it.

Arizona and Utah.—Sinking the shaft is progressing downward at the rate of 2 ft. per day. The winze in the main east drift at the first station is down 116 ft., the face still in low gradeore. The pumping machinery is working finely, and the water does not impede the progress of the work in the least.

American Flat.—Nothing has been done whatever in the south drift from the 450 ft. level of the Baltimore since our last report, on account of the heavy and continued flow of water from the face of the drift. The water is being rapidly lowered, and work will be resumed in the drift in a very short time.

Crown Point Ravine.—Draining the water from the shaft was commenced on the 25th of last month, and completed so that the men resumed work in the main west drift yesterday morning. This drift has only a few feet more to run to strike the ledge, when there is but little doubt that ore in paying quantities will be found.

Chollar-Potosi.—There has been little or no change during the week in either the quality or quantity of ore produced. The ore-breasts continue to both look and yield well. The cross-cut east from the main northwest prospecting drift at the fourth station, is driven ahead without material change of interest to report.

Justice.—The east cross-cut from the main south drift on the 400-ft. level is still pushed steadily ahead, the face in good ore. The south drift from the 260-ft. level of the old Wailer Defeat Shaft is making good progress, the face in low-grade ore. The main south drift on the same level is making excellent progress.

Utah.—Sinking the shaft downward is progressing at the rate of 3 ft. per day, the rock in the bottom working well and no water to impede the work. The new pumping machinery is fast approaching completion, and the future prospects of the mine look bright and encouraging.

Kossuth.—The shaft down is 100 ft., at which point the sinking has been stopped until the erection of the new steam works and pumping machinery is completed. Excellent progress is being made with the work, and sinking will be again resumed in a very short time.

Dayton.—Sinking the shaft for a sump, below the second station at the 210-ft, is completed. Opening the station and starting a drift west for the ledge will be commenced immediately. Work in the main drift west at the first station, will be commenced in a very few days.

Julia.—The main east drift on 800-ft. level, is in 600 ft., the face in quartz and porphyry. The flow of water from the south cross-cut in the main west drift at the 1,500ft. level is steadily decreasing, the hoisting tanks lowering it at the rate of 3 ft. per day.

Hale & Norcross.—Daily yield 25 tons of ore, mostly from the second and tenth station levels. Cross-cutting north on the 1500-ft. level has not developed anything of value. Sinking the north winze from the 1700-ft. level has been discoutinued for the present.

Yellow Jacket.—The cross-cuts from the main north drifts on the 1400 and 1500-ft. levels have developed nothing of value during the week. Everything in and about the mine is working finely, and good hopes are yet entertained of finding ore on these levels.

Baltimore Consolidated.—The water is being steadily drained from the second station, so that work can be again resumed on that level by the middle of next week. Prospecting at the first station goes steadily on, without change of interest to report.

Jacob Little.—The east cross-cut from the main west tunnel is in 23 ft., the face in fine ore. Assays taken from the face of the drift, gave $500 per ton in silver and $240 per ton in gold.

Knickerbocker.—The south cross-cut from the main west drift on the 400-ft. level, has made but slow progress during the week, on account of bad air. A patent blower has been erected, however, and this trouble overcome, so that good progress can be made. The face is in a mixturo of quartz and porphyry.

Sierra Nevada.—The ore breasts are being gradually extended farther to the north and westward, with but little change in either the yield or quality of the ore produced. Daily yield 60 tons of ore, keeping the mill steadily running.

Ophir.—Sinking the shaft is making steady progress, the rock in the bottom somewhat better than at our last report. Prospecting the different levels of the mine continues without any new developments of interest to report.

Savage.—Sinking the incline is making steady progress, the rock in the bottom working finely. Prospecting the 1,700-ft. level continues without any new developments of interest.

Empire.—Still cross-cutting on the 1,700-ft. level without any developments of material value to report. The upraise on the 1,500-ft. level is making good progress.

Buckeye.—The ore breasts on the different levels are looking and yielding as finely as usual. The mill is kept steadily running on ore from the mine.

Mexican.—Cross-cutting from the main east drift, at the second station, is vigorously prosecuted without change of interest to report.

Franklin.—The main tunnel is still driven ahead with excellent prospects of soon striking the ledge.

Imperial.—Prospecting as usual, with nothing new to report.

WHITE PINE.

International Mill.—White Pine *News*, July 26: Matters about the mill are in a forward state of preparation. The half-burnt and badly twisted machinery has been collected, and men are busily at work scraping off iron rust, stacking up bolts, nuts, screws, etc., ready for use in the various places they may be needed. The new building proper is to be 154 ft. long, with machine shop and outbuildings additional. There are to be 30 stamps with 16 pans, 8 settlers, and 4 agitatore, making a crushing capacity of 40 tons of ore per day. Much of the heavy timber, not destroyed by the fire, will be used in construction, and but little new machinery, if any, will be required; in fact, from the appearence of things, the energetic engineer seems to be making arrangements to manufacture all missing portions on the spot.

Mill at Shermantown.—J. B. Osborne's failings mill at Shermantown is rapidly assuming an appearance of completeness, and we are informed that it will soon be ready for a start. In view of the fact of the many improvements which have been added, we can confidently predict a success. There is a good lot of money to be realized from the enterprise, and we know of no man whom we would rather see make it than our friend Osborne. As soon as all is ready for a start, we shall visit the mill and give a description of it.

Stanford Mill.—This fine mill is constantly running on rock from the mines of the Eberhardt & Aurora Co., and thus far has obtained as high a percentage under the administration of Dr. Goodfellow as any institution in the country. The diamond drill, now being worked on the Hill, is for the purpose of developing the ground belonging to this company.

Eberhardt and Aurora.—From Manager Frank Drake we are informed that the mines of this company are looking splendidly, and producing their usual quota of ore. We shall take occasion to visit them next week, when a full report will be given.

Robinson District.—The Defiance is owned by McCauley, T. E. Yates and John Hall. A shaft has been sunk a depth of 95 ft., at which point a level was run easterly in a large body of good milling ore, assaying on an average some $35 per ton. There are now 150 tons of pay ore on the dump, and the mine is being constantly worked in a large body of mineral. As soon as the Watson Company's mill is finished the owners of the Defiance intend having a quantity of rock worked there, the proceeds of which will enable them to carry on their work of development.

Ward Beecher Consolidated.—On Tuesday last, we visited the principle mine owned by the above named company, known as the Edgar, and were able to glean the following facts: Since our last visit some weeks ago, work has been continuously prosecuted revealing daily larger and more valuable bodies of ore until a depth of 152 ft. from the surface has been attained, most of the way through good pay ore. The most wonderful development occurs at the first level (so-called,) 115 ft. from the surface, consisting of a body of ore-bearing rock of an assay value of $60 per ton, extending a width of 80 ft. east and west, across the vein, which has been explored thus far a distance of 100 ft. in length, with a prospect of continuity to an indefinite extent, the same width. Fifty men are now employed breaking down the ores from this vast area, and 35 tons are daily being shipped to the Manhatten mill, leaving considerable accumulated rock remaining in the mine and on the dump. Below the first level a continuation of the same body described above appears, and a force of men are engaged extracting the same. The fact that this ore body shows no signs of diminution, and that its course seems to be easterly, and downward, or into the hill, demonstrates to us beyond a doubt that the theory of permanency in the mines on Treasure Hill is established beyond a question. The principal and main difficulty now seems to be the want of proper and sufficient facilities for raising the ore to the surface. Instead of 35 tons, which is now the daily product, 70 could be laid upon the dump through the aid of machinery, instead of horse-power.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office, San Francisco:

Utah Excelsior M. Co., July 31: Utah Territory and Nevada. Directors: C. W. Gilmore, W. A. Swadley, Jerry H. Stevens, Frank Cunningham, James K. Herlot. Capital Stock, $4,000,000 in shares of $100 each.

Meetings and Elections.

New York Consolidated Mining Co., August 4. Trustees: J. D. Fry, (President), A. K. P. Harmon, Robert Sherwood, C. L. Weller, and T. W. Colburn; H. C. Kibue, Secretary; Thomas Brooks, Superintendent.

Consolidated Gold Hill Quartz M. & M. Co.—Aug. 5. Trustees: G. W. Besyer, R. F. Morrow, H. H. Flagg, M. Lewis and W. W. Stetson.

Tyler M. Co.—Aug. 5.—Trustees: Alpheus Bull (President), S. W. Lee, F. A. Sawyer, Philip Kitz and Geo. D. Roberts; Alfred K. Durbrow, Secretary.

Mining Pumps.—We sss by ths Virginia *Enterprise* that ths thrss largs pumps made in this city by David Stoddart, No. 114 Beale strsst, for ths Sutro Tunnsl Company, havs arrived at their dsstination. Ths pumps ars quits large, wsighing thrss tons each. Thsy ars of ths "Cameron" pattsrn, with soms slight modifications to suit ths requirsmsnts of ths company. Ws ars plsased to sss ths Tunnsl company buying their machinsry in San Francisco, for thsy havs procured a largs portion of it in ths Eastern States. Our foundrymsn can manufacturs all classss of mining machinsry much bsttsr and chsapsr than it can bs dons East, and thsy should always bs givsn ths prsfersncs by the mining companiss of ths Coast.

The San Dimas Mines in Msxico, aftsr many difficultiss ars now in a fair way to pay. Capt. C. B. Dahlgren of that placs, writss to a Nsvada papsr that aftsr 2¼ ysars work thsy havs finally gottsn thsir tsn-stamp mill running and ors comss in from all sides. Ths rssult of ths first run was $8,014 from 94 tons of ors, or $85.39 psr ton which was 84 psr cent of assay valus.

Joseph LeConte, Professor of Geology at ths Stats Univsrsity, has gons to Oregon, whers hs will in company with Rsv. Mr. Condon maks an sxamination of ths cliffs of ths Columbia rivsr. Ths locality to bs visited is rich in fossil rsmains, and Profsssor Ls Conts will collect for ths Univsrsity.

Woon Destroyed.—A firs occnrrsd on ths 2d inst., a fsw miles from Carson City, which destroyed soms 8,000 cords of wood, worth $7 psr cord. Half a mils of track and about a mile of flums wsrs also dsstroyed. All this wood was intsnded for uss at ths mills and hoisting works of ths Comstock mines.

The Victoria and Impsrial Tunnsl and Mining Co. havs rsscindsd ths asssssmsnt of 20 cents psr shars on account of valuabls dsvelopmsnts mads since it was lsvied.

Arlington District.

A correspondent of the *Alta*, writing from Los Angeles, says:

The newly discovered silver ledges of Arlington District are attracting much attentiou in this section. Returning from a trip thither, I am enabled to furnish the *Alta* with a brief sketch of their charecter, surroundings and whereabouts.

The Locality.

Arlington District, is found in Sau Bernardino county, on the desert slope of the mountains, eome sixty-fivo miles nearly east from Cajon Pass. From Los Angelee the route and distance may be given as follows: To Cucamonga, 43 miles; Cajon Pass, 26; Mojave River, 21; Rabbit Springe, 24; Cusenberry Springe, 10; Arlington District, 10 milee. Total from Loe Angeles to the mines, 134 miles. A wagon road leads directly to camp, and good water aud grass for animals can be had on the desert at each of the points named beyond Cajon Paee; none elsewhere on the desert portion of the ronte.

The District.

The discoveries leading to the preeent active operations were made last February, by a young prospector named Chileon (acting for himself), Capt. James E. Bryan and othere, of Anaheim, and the district was organized early in April. The camp has now upward of thirty occupants, and eome forty locatione have been made. The Fairfax, the first location, has received a large ehare of attention and been moet worked. On it are three exteneione of 1,500 feet each, the croppings being clearly traceable for that distance. Oliver Smith & Co., of Oakland, are interested in this ledge, and have an agent on the ground superintending ite development. Other locations on the eame ledge are controlled by eome of our connty capitaliets, and work is being puehed forward nnder the snperintendence of Capt. Bryan. Within thirty days there will have been completed a ehaft 100 feet deep, and a conuecting tunnel of equal length, every foot of which will, according to present indicatione, yield paying rock. From thie ledge some tons of rock have been shipped to San Francisco, and another shipment will be made per next steamer. The first lot returned per ton, in silver, $360; gold, $220. At a depth of eight feet, the ledge showe a width of about three feet. The Red Oxide, Home Ticket, Cash, Last Chance, Lone Mountain and othera are held in high esteem by their ownere, and jnstly so, if future developments sustain preeent promise. Work is being pushed forward on several of the claims as rapidly as the means of those engaged will permit. The ledges thus far located vary in width from one to four feet, and are all found in a eolid limeetone formation. They run northwest and sontheast with an easterly dip. The oree carry galena, some of them a large percentage, all bear more or less gold, are copper stained and ehow traces of the baeer metale. It is probable that the smelting procees will be found practicable in the reduction of many of these ores, at least such ie the belief of many who have given attention to the matter.

The Outlook.

There is no question regarding the richness of these deposits—ths miner'e pick and shovel, powder and drill, must demonstrate their extent. Should the developments on the Fairfax prove satisfactory, reduction worke will be at ouce thereafter erected at Cusenberry Springs, where there is an abundance of water, with an ample supply of wood growing in the adjacent cañons and upon the grim old monntain sidee. Both wood and water have been secured. The locations already made are embraced within an area of five miles long by two wide; but new prospectors are daily arriving, and are pushing their reeearches in every direction. Among others I noted the presence of Dr. Fonda, of Oakland, who was in good humor over a newly discovered ledge, specimens of which he had forwarded to San Francisco. Cabine for the winter are erecting, and all are confident that what are now mere ledges will be developed into lasting and payable mines. As matters look at the present the field is an inviting one for the prospector, and the capitaliet will not find it unprofitable to give the district eomething of attention.

Speaking of the great Sierra Madre Tnnnel in Colorado, tho Black Hawk *Journal* says: The map of the line of the tunnel shows that in a distance of two miles from the cover thirty-six known veine will be cut at depths varying from 200 to 1,000 feet. The Bobteil will be cut at a depth of 834 feet, which is about 400 feet lower than the Bobtail Tunnel cuts it. It cuts the Gregory 775 feet below the surface, there heing a depreesiou at that point.

Bankrupt.—Charles E. Pearson has filed a petition in the United States District Court to declare the Woodhill Gold and Silver Mining Company bankrupt, alleging that the Company is indebted to him in the sum of $3,000. Since the petition was filed the Company has consented to an adjudication.

Michigan Capitalists continue to invest in Utah mining property. The Laet Chance and Galena minee in Bingham, were eold this week to eome of them for $25,000.

A Peep at the Fishes—Woodward's Aquarium.

The annexed engraving gives a somewhat fanciful illustration of what an aquarium is. The artist has pictured on the right one of the most singular varieties of the *Octopod*—one which Victor Hugo has immortalized under the name of "devil fish," diminutive specimens of which are often caught by our fishermen near the Golden Gate. One of these monstrosities was brought to Woodward's Gardens on the 4th inst., but it arrived in a dying condition, and was not placed in the aquarium. Just above is seen a specimen of the *Nautilus Argonaut*, better known among sailors as the "Portuguese Man-of-War;" below this is seen something which the artist has evidently intended for the next new thing which is to be discovered in the "vasty deep." To the left is shown a variety of marine plants, an almost infinite number of which are found growing in the sea, varying in character and size from the tiniest, grass-like blades to huge growths, fairly rivaling in height and dimensions the tallest trees in our forests. The importance of this marine growth, not only in the sea, but in aquaria, as well, is given in another article, already referred to.

We have introduced this cut at this time more especially to call attention to the fine aquarium exhibition which Mr. Woodward is now making at his Gardens, on Mission street.

This aquarium consists of 16 Frear-stone tanks with plate glass fronts, arranged on either side of a spacious hall, constructed in imitation of a subterranean grotto, faintly lit up by the light which is thrown from above upon the surface of the water in the tanks, and rendering every movement of the finny captives perfectly distinct to the observer. The most perfect exhibition possible is thus obtained, and it is difficult to describe the novelty and the surpassing interest of the sight.

The work of stocking such an aquarium is a large one, and some of the tanks are still empty; but enough is to be seen to satisfy every one. Both salt and fresh water fish are shown, each in its appropriate element.

The tank containing the crabs, craw-fish and lobsters attracts the most attention. These queer animals can be seen in all their grotesqueness, crawling and creeping about, now upon the gravelly bottom and now climbing, in their awkward manner, up the side of the rough stones, piling themselves upon one another and sometimes bracing themselves up against the glass front, as though to take a leisurely view of their curious observers upon the outside. These are the *scavengers* which eat up the filth and decaying matter, the presence of which is so deleterious to the members of the finny tribes.

Perhaps the most curious of all is the tank containing the sea anemones, which look so much like plants, and which in fact form the connecting link between the flowery kingdom and active marine life. These anemones are in reality animals. If a morsel of fresh meat or fish is dropped into the centre of one of these beautiful floral crowns, these countless tentaculæ will instantly close upou it, and convey it to the capacious mouth around which they play, waiting for the chance morsel which may come in their way. After this movement the florescence will again expand and nothing will be seen of the food.

Several small sharks are seen disporting themselves in one of the tanks, in company with some "devil fish," not those of the Victo Hugo stripe, however. Several other queer looking finny curiosities are also keeping quiet company with the sharks, the usually sharpened appetite of the latter being probably subdued by the abundance of food furnished them by their generous proprietor—for everybody knows that Mr. Woodward is a generous provider, whether for man or animal.

But we have no time to allude, in detail, to the rich and rare treat here presented to the curious, and would close this notice by remarking that this interesting exhibition of animated nature has been devised and carried forward to its present degree of success, under the especial supervision of Mr. Chas. Schumann, who, at Mr. Woodward's instigation, has recently visited all the principal aquaria of Europe to study their models and management, in order to leave nothing undone to make this a success in every particular.

AQUARIUM AT WOODWARD'S GARDENS.

The History, Development and Utility of Aquaria.

Ichthyology is a hard word to master, but it is, nevertheless, so fast assuming a prominence that it promises soon to become a household word. Very little was known, until quite recently, of the habits of the denizens of the deep. The movements of a few edible fishes, which inhabit shallow water, had been studied a little; but of the great mass of the finny tribes we knew absolutely nothing,—not so much because of a lack of interest in such knowledge, as for the reason that we had no means of acquiring the desired information. In fact, the inhabitants of our rivers, oceans and lakes were nearly as much concealed from observation as they would be, were they inhabitants of another world. But the activity and persistence of thought and research, at the present day, have most effectually overcome the principal obstacles to studies of this kind, and finally laid open to the most common observatiou well-nigh all the conditions and curious facts connected with life in the water. The dredging of ocean-beds and even the deepest sea-soundings have revealed the most astonishing fact that life exists even at very great depth, and under conditions of pressure which seem almost incredible.

But little difficulty has been found, to learn what of life the sea contains; but to become acquainted with the habits, mode of life, etc., of the denizens of deep water was almost impossible until the aquarium was introduced, whereby we could preserve the lives of fishes under conditions which would permit of our constant examination of them while free to move and act at will.

It has long been known that animals living in water may be kept in transparent glass vessels, by frequently changing the water; but it is only by the modern discoveries of chemistry and physiology that means have been pointed out, whereby aquatic life may be long maintained without the frequent and inconvenient renewals of the water. Science has now taught us that plants, growing in water, restore to that element the oxygen so necessary to the life of the fish, and remove therefrom, by absorption, the carbonic acid thrown off by them as by land animals in the process of respiration.

Again, it has been found necessary to add certain varieties of water animals, which feed on decomposing animals and vegetables, to act as scavengers for the more particular members of the fish community, to whom any considerable amount of decaying matter is found injurious or fatal. The discovery of these facts and conditions has made the employment of aquaria on a large scale a practical possibility, and introduced to the world a new and most interesting means of material progress in the study of natural history.

The first experiment of this kind, on a large scale, was undertaken at the Zoological Gardens, Regent's Park, London, in 1853, only twenty years ago. Quite a number of tanks were there fitted up, the largest of which were six feet in length by thirty inches in depth. They were fitted very much as those now shown at Woodward's Gardens have been, and were supplied with sand, gravel, appropriate vegetation, molluscs for scavengers, etc. The water was simply allowed to run off and be pumped backed again, falling into the tanks, as seen at Woodward's, in such a manner as to carry considerable quantities of air entangled with it. Thus a given quantity of water can be used indefinitely, care being taken to secure the presence in the tanks of such fish as will act as scavengers in removing any decaying substances which may be present.

It should be borne in mind that air is as necessary to sustain life in aquatic animals as it is for those which live upon land; the gills of the former serving the same purpose as the lungs of the latter—the blood being decarbonized or purified by the particles of air, which are mixed with the water, coming in contact with the gills, just as the blood of land animals is purified by coming in contact with the air in their lungs.

The success which attended the aquarium at Regent's Park induced the construction of aquaria in several of the large cities of Europe, and finally in our own country. The largest and most complete work of this kind has been recently constructed at Brighton, one of the most famous and charming watering-places in England. It was opened to the public about one year ago, after nearly two years of time and a vast outlay of money had been expended in its construction. This aquarium is divided into a series of corridors, the largest of which is 220 feet long, most beautifully and appropriately ornamented. The aquarium contains a great number of tanks, some of unusual size, and the largest of which is 120 feet long!

The London Crystal Palace aquarium, though smaller than that at Brighton, is nevertheless 400 feet long by 70 broad—all the tanks having a capacity of 200,000 gallons of water, equal to 500 tons in weight. There are now, we believe, three aquaria in England; one each in Berlin, Hamburg, Havre, Paris, and one quite recently opened in Naples, 100 by 70 feet in dimensions.

Several works of the kind have been constructed in the United States, but that recently opened by Mr. Woodward, at his Gardens in this city, is the largest and most complete, and that gentleman is deserving of the highest credit for the enterprise and zeal which he has displayed in furnishing the public of California with such an extensive and useful medium for the study of one of the most interesting branches of natural history.

A most complete opportunity is here provided for watching the movements and habits of living creatures, possessing most interesting and remarkable characteristics, but whose haunts have heretofore been confined to the most obscure and unapproachable recesses of ponds, rivers and oceans. By the facilities which Mr. Woodward has here provided, the student is able to actually walk amid the very habitations of the most curious and recluse of the finny tribes, where their every movement is as open and free to observation, as is that of the tiny gold-fish which disports itself in a crystal globe upon a parlor table. Such an exhibition cannot fail to prove a source of unlimited interest to the sightseer, and an object of the most intense gratification to the scientific investigator. A volume of natural history is opened here, illustrated and illuminated in a manner which cannot fail to excite the interest and attention of the most indifferent; and certainly no one who will look upon it can go away uninstructed or unimpressed with the volume and its pages. A writer upon Natural History, says:

"Studies of animated nature have been pursued with increased ardor and success since the establishment of aquaria. Vast regions of animal and vegetable life, the mere existence of which was known to but a few of our leading naturalists ten years ago, are now explored by thousands of observers, and the wonders of the brook, the river and the mysterious sea have become familiar things among persons of intelligence and scientific inquiry, who, without the help of the aquarium, must, for lack of leisure and means, have remained content with brief technical descriptions conveyed in ponderous books, to the perusal of which there would have been no sympathies to attract them. It has created a taste for deep sea studies and then fed that taste with wholesome truths; and by giving delight to the eye and stimulating through the medium of recreation the spirit of scientific inquiry, it has brought subjects of profoundest interest within the practical reach of the bumblest student of the ways of God and Nature."

Who can tell the interest or enthusiasm in scientific study and research which may be engendered in the minds of the thousands of children and youth who weekly visit the vast and instructive collections in all the various branches of natural history, botany, mineralogy, etc., which have been collected and thrown open to the public in this vast conservatory of art and science. If Mr. Woodward had never done anything else, this work alone would form a monument of industry, genius and usefulness which any man might well be proud to leave as a legacy of life-work to future generations.

A grand safeguard for doing right is to hate all that is wrong.

Utah Smelting Works.

The Salt Lake *Tribune* has been visiting the Smelting worke at Fleck's Station and says: Through the courteey of Henry Sieger, Esq., the Superintendent of the

Germania Separating and Refining Works.

We learn the following particnlare regarding the progress made during the past month, and the future intentions of thie enterprieing and very commendable compeny.

From the third day of June to the first day of the present month, the works turned out 85,000 ounces of silver bars, 400 tons of pure lead, and 858 onnces of gold.

Another blast furnace hae been added to the establishment, which is intended to work over the drop end ekimmings from the bullion.—The worke can now with the addition of thie other furnace and some slight modificatione in the working, work off in ten days the whole stock of silver, gold and lead contained in the dross, skimmings, etc.

One of the furnacee hae been altered for the purpose of running copper from the bullion, a good deal of the former of which is contained in the latter. During the stoppage of the works, an estimate wae made which proved that by the Flach's system the whole loss of lead did not reach four per cent., whilst on the silver there wae absolutely none whatever.

The company has purchased the exclusive right of the Flach's process for Utah and California, and the capital etcck has been raised to $600,000. Mr. Sieger will, in a few days start for San Francisco, for the purpose of superintending the erection of exteneive worke in that city for eeparating and refining bullion, also for the manufacture of white lead. The buildings in question will be commenced next September, and it is expected that they will be finished and in operation by the first day of April, 1874.

The Wassach Smelting Works.

Extensive additions and improvements are being made to this eetablishment.

During the last nine working days eighty-five tons of bullion were produced from one furnace from two hundred and thirty-nine tons of ore.

The old chimney stack has been pnlled down and another and much larger one, seventy feet high, has been built to meet the requirements contemplated.

Tho old and reverberatory furnace which was inconveniently huilt alongside of the blaet furnaces has been also demolished, and a new one has been built on the floor above, while the foundation of two othors has been laid.

The new blast furnaces of a capacity of thirty-five tons of ore each per diem are to be added, making in all three, to correspond with the number of the reverberatory furnacee.

The ore being now worked ie from the Spanish mine, Bingham Cañon, and assaye on an average, fifteen ouncee in eilver, and forty-five per cent in lead.

The American Smelting Company.

This establishment, formerly known as the Robbins works, is undergoing exteneive alterations to meet the requirements of a large custom bnsiness during the preeent season.

A new forty-horse power steam engine is being put np, also the largest sized blast ever introduced into this Territory.

The old engiue and blast will be retained for working the blast fnrnace erected by the Messre Robbins.

The new furnaces have just been completed, one with two tuyeres and the other with three tuyeree. These furnaces are of different construction from those commonly in use in the territory, being provided with dust chambere for the pnrpose of saving the ore which it is contended is lost in the ordinary furnaces.

The reverberatory furnace which wae in the building at the time the present company took possession, will be used for the purpose of roaeting the ore before it goee into the blast furnacee.

The ore now subject to treatment is from the Wellington mine, Little Cottonwood, and the Miner'e Delight, belonging to the Ophir Silver Miuing Company (Limited).

Leaching. — The Reese River *Reveille* describes the leaching process in uee at the El Dorado works as follows: Thie process is very simple, cheap and effective. Three large tubs, six feet in diameter and five feet deep, are placed convenient to the Stetefeldt furnace. The tubs have a false bottom, perforated with quarter-inch holes. This false bottom ie tightly covered with canvae and the edges corked tight. The false bottom is placed one foot above the bottom of the tub; the tnb is well filled with the ore as it comes from the furnace. Hot water is then turned in; the plug below the falee bottom is drawn, and the leeching procees commencee. The chloride of copper, chloride of iron, sulphate of soda, as well as any excess of salt, pass off in solution through emaller tubs which contain scrap copper to precipitate any silver that may have found ite way out in the eolution. From the small tubs the eolution pasees off through shicee which are charged with metalic iron, decomposing the chloride of copper, precipitating cement copper and forming chloride of iron. The base metals are thus run off from the big tub, leaving the pulp containing the silver quite pnre and ready for amalgamation. It is expected to extract abont eight per cent. of copper per month. The procese takes about one and a-half to two hours. The bullion will be much finer than heretofore, eaving 25 cents per pound in its shipment. The other portione of the El Dorado mill are in splendid working order.

Useful Information.

The Pin Machine.

This machine is one of the closest approaches that mechanics have made to the dexterity of the human hand. It is about the height and size of a lady's sewing machine, only much stronger. On the side at the back a light belt descends from a long shaft in the ceiling that drives all the machines, ranged in rows on the floor. On the left side of the machine hangs on a peg a reel of wire that has been straightened by running through a compound system of small rollers. The wire descends, and the end enters the machine. This is the food consumed by this voracious little dwarf. He pulls it in and bites it off by inches, incessantly—140 bites to the minute. Just as he seizes each bite, a little hammer, with a concave face, hits the end of the wire three times, "upsets" it to a head, while he grips it to a counter-sunk hole between his teeth. With an outward thrust of his tongue he then lays the pin sideways in a little grove across the rim of a small wheel that slowly revolves. By the external pressure of a stationary hoop these pins roll in their places as they are carried under two series of small files, three in each. These files grow finer toward the end of the series. They lie at a slight inclination on the pins, and a series of cams, levers and springs are made to play like lightning. Thus the pins are dropped in a little shower in a box. Twenty-eight pounds are a day's work for one of these jerking little automations. The machines reject crooked pins, the slightest irregularity in any of them being detected.

Heat.—Many common practices can easily be explained by noticing the different absorbing and radiating powers of various substances. A dish-cover or metal tea-pot is kept as bright as possible, so as to prevent the escape of heat by radiation; a black earthenware tea-pot, on the other hand, has a dull and dark surface, so that it may absorb the heat. So, too, if a kettle is to heat quickly, the part exposed to the fire should be covered with fur and soot, to absorb the heat; the other part should be bright to radiation. These things, like many similar ones, were known, and put in practice long before their true causes were known, but science shows us now how to account for them.

The laws of radiation likewise account for the deposition of dew at night. The air is then cooler than the surface of the earth, and the latter accordingly radiates its heat into space. Those bodies, therefore, which are the best radiators, become cool most rapidly, and therefore condense the vapor which exists in the air. Plants radiate freely, and hence become coated with dew, while a smooth road remains almost dry. Clouds of great extent prevent this radiation, and hence the dew will be most plentiful on a clear and cloudless night. A very thin layer of calico, or matting, is likewise sufficient to retard radiation, and for this reason gardeners often place a covering of this kind over delicate plants to protect them from injury by the cold. When the temperature of the ground is very low the dew freezes as it is deposited, and constitutes hoar-frost.—*Popular Educator.*

Breathing and Thinking.—Let any one think for a moment what he experiences when he breathes and attends to the act. He will find that his whole frame heaves and subsides at the same time; face, chest, stomach and limbs are all affected by his respiration. Now let him feel his thoughts, and he will see that they, too, heave with the mass. When he entertains a long thought he draws a long breath; when he thinks quickly, his breath alternates with rapid alternations; when the tempest of anger shakes his mind, his breath is tumultuous; when his soul is deep and tranquil, so is his respiration; when success inflates him, his lungs are as tumid as his conceits. Let him make trial of the contrary; let him endeavor to think in long strctches at the same time he breathes in fits, and he will find that it is impossible; that in this case the choppiug lungs will still mince his thoughts.

Hair of Different Races.—Somebody who has been studying the matter of the form and substance of the human hair in different races, finds that the hair of the North American Indian is cylindrical, that of the white race is oval, and that of the negro may be termed elliptical. It is also found that when the hair is cylindrical, the stretching and shriuking powers are equal on all sides of the filament, and this condition gives it the lank, strait appearance of that of the pure-blood Indian. The oval hair displays a greater number of fibres upon the flattened side than elsewhere, a condition which gives to such hair a tendency to curl or curve in that direction. When eccentrically elliptical, it not only always curls, but often assumes a spiral shape, as on the head of the negro. The hair of the Chinese is nearly cylindrical, and hence it is that curled hair is almost unknown among that people.

What is a "Stone" Weight?—A stone, horseman's weight, is 14 pounds; a stone of butcher's meat, 8 pounds; a stone of iron, 14 pounds; a stone of glass, 5 pounds; a stone of hemp, 32 pounds; a stone of cheese, 16 pounds. Clear and simple, certainly!—*London Builder.*

To Remove Paint from Stone.—A correspondent of the *London Builder*, having to clean a pulpit and sedilia in which the carving and tracery were almost filled up with successive coats of paint, was informed that common washing soda, dissolved in boiling water, and applied hot, would remove it. He says, "I found that 3 lbs. of soda (cost 2½d.) to a gallon of water, laid on with a common paint-brush, answered the purpose admirably, softening the paint in a short time, so that it was easily removed with a stiff scrubbing-brush; afterward, on adding a few ounces of potash to the solution, it softened more readily than with the soda only. The stone in both cases was a fine freestone."

Chestnut Timber. — The London *Garden* says the roof of Westminster Abbey, which has long been supposed to be of oak, when examined some time ago as to its soundness, and found to be perfect, was discovered to be of chestnut. It has stood for eight centuries already, which would go to show that chestnut timber would at least serve any such purpose now very excellently. Another very valuable quality it possesses is, that its growth is many times more rapid than that of oak.

The cohesive force of the best red sealing wax has been proved to be equal to 1,500 lbs. per square inch, and that of the black sealing wax rather more than 1,000 lbs. to the square inch; the deficiency in the latter is attributed to the diminished quantity of lac used in the composition. The cohesive force of solid glue was found he 4,000 lbs. per square inch; that of cast iron is 25,000 lbs.

Catching Rats.—A gentleman who has tried it says the best way to catch a rat, which has found its way into your room, is to lay a boot flat upon the floor, close to the mold-board. The rat will run into the boot leg for protection, when he is readily captured.

Good Health.

The Abuse of Appetite.

The appetite is one of the least appreciated of Nature's gifts to man. It is generally regarded in this work-a-day world as something to be either starved or stuffed,—to be gotten rid of at all events with the least inconvenience possible. There are people who are not only not glad that they have been endowed with sound, healthy bodies, for which nature demands refreshment and replenishment, but they are actually ashamed to have it known that they are sustained in the usual manner. The reason of this we are at a loss to conceive. Everybody admires beauty, and there can be no true beauty without good health, and no good health without a regular and unvarying appetite. We are disinclined to let appetite take any responsibility on itself. If we happen to consider it too delicate, we try to coax it, perhaps stimulate it with highly seasoned or fancifully prepared food. There are times when this may seem necessary, as in the case of a person so debiliated as to depend for daily strength on what he eats. But, usually, the cajoling process is a mistake. If the appetite of an individual in fair bodily condition be occasionally slender, it is no cause for alarm, and it should be allowed to regulate itself. It may safely be considered Nature's protest against some transgression, and it is wise not to attempt coercion.

At certain seasons, as in spring and summer, the appetite of even the very robust is apt to fail, and the relish for meats and heavy food to wane. This is all right enough, for animal diet in warm weather heats the blood, tends to headaches, and is generally unwholesome, unless sparingly used. On the other hand, fresh vegetables, berries, fruit and bread are cooling, corrective, and what the palate most craves. Don't be afraid to go without meat for a month or so, and, if you like, live purely on a vegetable regimen. We will warrant that you will lose no more strength than is common to the time, and that you will not suffer from protracted heat, as when dining on the regulation roast.

Many persons regard a hearty desire for food as something unrefined, indelicate, and to be constantly discouraged. This is a greater and more harmful mistake than that of coaxing the appetite. It is just as necessary for the man who works only with his brain to eat beef and mutton, as for the man who labors solely with his hands. The stomach and the brain are twins; the former being the elder, and having prior right to care. Let that be well provided for; and it will sustain its brother. The people who strive to cheek a wholesome and natural appetite are the people who regard dinner merely as a feed, not the center of an agreeable social custom and as the domestic event of the day. We are sorry for them, as they must regard eating at all as a prosaic duty, obligatory on them because they have a bias in favor of living. We all know that we must eat to live; but we by no means live to eat simply because we enjoy what we eat. We are not gourmands because we relish chops, nor are we invalids because we want strawberries.

A good appetite is a good thing; but not if it is to be worried by urging or by neglect.—*Scribner.*

How to Sleep.

With many the inability to sleep, as a growing habit, is the first step toward certain madness; in every disease it is an omen of ill. Hence, to cultivate sound sleep, do not sleep a moment in the day-time. Go to bed at a regular hour, and never take a "second nap" after waking of yourself in the morning. Take nothing after dinner but a piece of bread and butter and one cup of hot drink—not China tea, as it makes many wakeful. Never go to bed with cold feet. Read nothing after supper, listen to nothing, talk about nothing of a very exciting character; avoid carefully every domestic unpleasantness, as to child, servant, husband or wife. Let no angry word be spoken or thought harbored for a single instant after tea-time; or sleep may not come before the morning light. Grown persons generally require about seven hours' sleep in summer and eight in winter. Few indeed, except invalids, will fail to sleep well who go to bed at a regular, early hour, on a light supper, in a large room, and clean, comfortable bed, if there is no sleeping in the day-time, and not more than seven hours in any twenty-four are passed in bed. One week's faithful trial will prove this. Children, and all persons at school, should take all the sleep they can get, and should never be waked up in the morning, after having gone to bed at a regular, early hour. Every humane parent will make it a religious duty to arrange that every child shall go to bed in an affectionate, loving and glad spirit. If wakeful during the night, get up, draw on the stockings, throw off the bed-cover to air it, walk the floor in your night gown, with the mouth closed, all the while rubbing the skin briskly with both hands, until cooled off and a little tired. Except from August first to October first, in fever and ague localities, a chamber window should be open two or three inches in length.—*Herald of Health.*

Blushing.—Darwin, in his new work, on "The Expression of the Emotion in Man and Animals," has an interesting chapter on blushing. This act, he tells us, is the most peculiar and human of all expressions. Animals never blush, although monkeys redden from passion. We cannot produce blushing by any physical means; it is the mind which must be affected and blushing is not only involuntary, but the wish to restrain it increases the tendency. While the young blush more freely than the old, infants do not blush; women blush more than men; the blind and the deaf do not escape. It is usually the face, ears and neck only, that redden; the blush does not extend over the body; but certain races who go habitually nearly naked, blush over their arms and chests, and even down to their waists. The limitation of blushing to exposed parts is explained by the fact that these portions of the surface have been habitually exposed to the air, light, and alternations of temperature, by which the small arteries acquire the habit of readily dilating or contracting. Hindoos blush but little; the Chinese rarely blush; the Polynesians blush freely; the young squaw of our American tribes has been seen to blush; the Kaffers of South Africa never blush, neither do the Australians.

Farming and Insanity.—Reports of lunatic asylums are sometimes instructive reading. For instance, the popular notion that the life of the farmer, and especially in those sections where the farmer and his wife devote themselves to unremitting hard labor, is most conducive to the mental stability, is dispelled by the statistics of lunatic asylums in general.

In the Michigan asylum the farming class preponderates over all other classes; and taking the asylums of the country together, it appears that more than one-fourth of all the lunatics of the country are farmers and merchants. With the farmer the cause unquestionably is too much work, too little recreation and habitual violation of the laws of health—too frequently the laws of cleanliness. Speaking of the farmer's wife, says the writer: Her scant ablutions are performed in haste; she has little time to spend on her person, and none in which to read. Night finds her weary with much doing. She goes to bed tired out, to be kept awake half the night, perhaps, by a fretful babe. From January to December her only recreation is going to church—it may be every Sunday, it may be twice a month. Is there any wonder she becomes an inmate of the lunatic asylum? This is not only the case with wives of small farmers, but those who have added acre to acre, and grudge money spent for household labor.

It appears from the researches of Dr. D. J. Macgowan, of Shanghai, that the medical virtues of fish oil as a cure for lung complaints was known to the Chinese many centuries ago. But instead of codfish, they take the oil from the shad. Acting on this hint, our apothecaries may perhaps be saved the necessity of sending to Newfoundland for their supplies, as the waters of the Hudson, Connecticut, Chesapeak, and other rivers will afford an abundance of the medicine.

Put the Bright Side Out.—Like most garments, and most carpets, every thing in life has a right side and wrong side. You can take any joy, and by turning it round, find troubles on the other side; or you may take the greater trouble, and by turning it round find joy on the other side. The gloomiest mountain never casts a shadow on both sides at once, nor does the greatest of life's calamities.

Domestic Economy.

How to Make Good Bread.

Prof. Horsford recently gave a public lecture in New York upon "The Philosophy of the Oven," in which the whole history of bread-making was discussed. We extract from the report of the lecture the following directions for making good bread: "Select good, plump, fully ripened, hard-grained wheat. Have it freshly ground and not too finely bolted. Prepare the yeast as follows; boil thoroughly with the skins on, in one quart of water, enough potatoes to make a quart of mashed potatoes. Peel the boiled potatoes and mash them to fineness; mix intimately with them one pint of flour, and stir the whole to an emulsion with the water in which the potatoes were boiled. Cool the product to about 80° (lukewarmness), and add half a pint of the best baker's fresh yeast, and a tablespoonful of brown sugar. Set aside the mixture at an even temperature of about 80°, till it works well, or is in active fermentation. Of this yeast take half a pint to a gallon (7 lb.) of flour, mixed with three pints of water, or two of water and one of milk, all at the temperature of 80°; add a little salt, knead thoroughly, and set aside to raise at the temperature mentioned. When it has risen to nearly the full volume for the dough, divide it into loaves, knead again, set it aside at the temperature already named until it attains the full size of the loaf, and place it in an oven heated to not less than 450°. Let the loaves of dough be smaller than the tins. Keep them covered with flat tin plates or stiff paper until the dough is fully raised and the heat carried up to, and sometimes maintained throughout the loaf at 212°, to convert all the starch to the mucilaginous or emulsion form and destroy the ferment. Then remove the cover, and permit the browning to take place. If the loaves are large, a higher temperature will be required, Seven pounds of flour will make eight loaves of 1¼ lb each when baked, or four 2½lbs. each. Such yeast as is above described will keep a week in winter and from two to four days in summer. Bread made with it, in faithful obedience to these instructions will be good."

Squirrel Stews.—Half-a-dozen of these marauders make a nice dish to set before as many grown-up people who relish fresh meat for dinner. The squirrel lives upon the best of food, and lives a free, active life, but its very activity gives its muscles a tendency to toughness. This can be overcome by sufficient boiling. In the first place, it must be carefully skinned and dressed while yet warm. If the entrails are left in the animal until the body is cold they will injure the flavor of the meat more or less. Put them in cold water enough to cover them, and skim the pot carefully when it comes to boiling (this always in boiling or stewing meat or in making soup). Two hours' gentle boiling is not too much for young squirrels, and three hours for old ones. Never season them until they are done tender, and then you will add salt and cream, or a bit of butter, according to your judgment. A little thickening (a tablespoonful of flour stirred smooth in half a cup of milk or water) stirred in while the pot is boiling will make a nice gravy. Pour the whole over slices of bread or split gems. The strong flavor of squirrels comes from the fat. Cut this all away carefully before cooking.

A First Rate Pumpkin Pie.—Cut the pumpkin in half, put it in a dripping pan, skin side down, (after the seeds are removed) in a slow oven; bake until all the good can be easily scraped from the rind with a spoon; if it is as brown as nicely baked bread all the better; mash finely, and to one quart add a quarter of a pound of butter while hot; when cool, sweeten to the taste one pint of milk or cream, (if cream be used three eggs will be sufficient, if milk four will be better,) beat them separately, stir in the yolks, two teaspoonfulls of cinnamon, one of nutmeg, a wine glass of wine or brandy; lastly add the white of the eggs, stirring but little after they are added to the mixture; bake in a quick oven.—*Germantowne Telegraph.*

While ten men watch for chances, one man makes chances; while ten men wait for something to turn up, one man turns something up; so while ten men fail, one succeeds and is called a man of luck, the favorite of fortune. There is no luck like pluck, and fortune most favors those who are most indifferent to fortune.

TABLE OF CONTENTS.

GENERAL EDITORIALS.—New City Hall, 81. A Peep at the Fishes—Woodward's Aqusrium, 86. School of Mines, Columbia College; Description of a New Species of Alcyonid Polyp, 88. Pops Valley Quicksilver Mines; Acsdemy of Sciences; Circulsr Iron Clads, 89.

ILLUSTRATIONS.—New Clty Hsll, San Francisco, 81. Aquarium st Woodward's Gardens, 86. Map of Pope Valley Quicksilver Region, 89.

CORRESPONDENCE.—The Visnna Exposition; Notes of Trsvel in White Pine County, Nevada, 82. A Plea for "The Civil Damages Act," 90.

MECHANICAL PROGRESS.—Important Information if Valid; Deposits in Boiler Flues; Messurement and Loss of Power—Improvement in Journal-Boxes; The New Metal Indium; Cosl Oil for Locomotives in Russia, 83.

SCIENTIFIC PROGRESS.—Outlines of Mountsins; Sugar a Test for Potato Water; A New Experiment; Ozone by Slow Oxidation; The Metals of the Sun; Chemical Prizes Offered in Frsnce; A New Relation Between Electricity and Hest; Ths Variable Size of ths Sun; Thallium from Vssuvius; Combustion of the Diamond, 83.

MINING STOCK MARKET.—Table of Dsily Sales snd Prices and Comparstivs Prices for tbe Week; Notices of Assessments; Meetings snd Dividends; Review of Stock Market for the Week, 84.

MINING SUMMARY from various counties in Californis and Nevads, 85.

USEFUL INFORMATION.—The Pin Macbins; Heat; Bresthing and Thinking; Hsir of Different Races; What is a "Stone" Weight? To Remove Paint from Stone; Chestnut Timber; Rats, 87.

GOOD HEALTH.—The Abuse of Appetite; How to Sleep; Blushing; Farming and Insanity, 87.

DOMESTIC ECONOMY.—How to Mske Good Bread; Squirrel Stews; A First Rate Pumpkin Pie, 87.

MISCELLANEOUS.—Mint Operations for July, 82. Arlington District; Utah Smelting Works; Lescbing, 86. Valuable Mineral Deposits; Weights of the Different Metals or Ores to the Cubic Foot; The Public Domain; Iron Pyrites and Fire Arms; Patents and Inventions, 89.

THE COBBLE CUTTING MACHINE.—The crowded state of our columns forbids any detailed description of the new machine for cutting cobble stones for pavements, which was tried this week. It worked very well and accomplished the object for which it was invented, with apparent eaee. We puhlished in March last an illustration of the cohble stones as they appear after having been operated on hy the machine. Since that time, however, some improvements have been made in the device, and it is now run by steam instead of by hand. The machine was made at the Miners' Foundry for Messrs. Jacoh Bollinger, Louis Dutertre and E. D. Sawyer. We hope to he able to explain this novel invention in detail in a future issue.

MR. GUIDO KUSTEL, well known in mining circles on this coast, who has been writing letters to this paper from Vienna, will shortly return. Before doing so, however, he will visit several mines and works and obtain drawings of whatever is of interest to this coast in mining machinery. He writes us that in the matter of concentration of oree, the old systems are entirely changed. Mr. Kustel will continue writing of what he saw of interest at Vienna, after he returne here.

AT the Fourth of July dinner, in Vienna, the toast "The International Exhibition of 1876—The United States Centennial Commission and its Work," was responded to in a happy manner by W. P. Blake, a member of the commission. Professor Blake is well known as editor of the American official reports of the Paris Exposition, and also in his connection with the mining interests of the United States and the Pacifio Coast in particular.

IRON ORE.—The Commissioner of the general land office has decided that parties desiring to acquire land containing valuahle deposits of iron ore, must comply with the previous articles of the act of May 10th, 1872, except in the states of Michigan, Wisconsin, and Minnesota, which by Act of Congress of March 3d, 1873, are expressly relieved from ite operations.

The School of Mines, Columbia College.

We have before us the last annnal catalogue of the School of Mines, Columbia College, New York City. This scientific school, while very thorough in its branches of Civil Engineering, Geology, Natural History, Analytical and Applied Chemistry, is better known on this coast for the excellence of its departments of Mining Engineering and Metallurgy. In these and in Analyticsl Chemistry it nndonbtedly stands at the head of our American schools. The attention of mine and mill owners is being turned more and more to onr professionsl institutions. It is to them that we must look in fnture for competent snperintendents and engineers, for however perfectly a "practical" man may nnderstand how to perform the usual rontine of work laid before him, he is ever at a loss when the perpetually recurring, nnforseen emergencies happen. Bnt with the broad basis of a liberal education and with that experience which should, more properly, come in place snbsequently to theoretical training, one will always be prepared and able to grssp and master any nnexpected difficnlty that may occur. We are glad also to note that more interest is shown in the scientifio professions by onr yonng men. Time was, when the popular taste ran exclusively to the study of law and medicine. Time is, fortunately, when practicsl science comes in for its share of attention and perhaps even a little more—if that be possible—for it is now even more cultivated, in proportion to the field of occupation, than the other professions.

The course of study comprises three regular yesrs, with a preparatory department added. A graduate of a college is admitted, without preliminary examinstion, to the first year. We omit details of the general mode of instruction employed, and pass at once to the depsrtment of

Mining Engineering.

Mining engineering is taught dnring the second year. The instruction comprises a conrse of lectures illustrating the theory and practice of mining operations at home and abroad; giving the general principles of reconnoitering and surveying mineral property and mines; the attack, development, and administration of mines and the mechanical preparation of ores, with the exhibition and use of all necessary reconnoitering and surveying instruments, particularly the mining theodolite, and the exhibition of various models. In surveying, the student is taught to make surface and subterranean surveys, to direct and adjust his works; also the solution of some problems of underground surveying hy descriptive geometry, and many special examples of determining lines on the surface corresponding to given lines below, etc. Attack describes the miners' method; the use of drills, picks, powder, nitro-glycerine and new explosives, compressed air, etc.; the proper location and construction of tunnels, slopes, shafts, wells for senndiug, artesian wells, salt and oil wells; preceded by a theory and description of the most typical veins, trne or irregular, and other deposite of ore, salt, coal, and oil, exemplified at home and abroad. Development includes the description of the best methods in experience of laying out snbterranean works for production and conservation in the present and future; for proper and economic ventilation, transportation, hoisting, pumping or draining, distribution of workmen, etc. Adminietration includes a review of the foregoing, with regord to the concentration of ideas and general compsrison of production cost to market price of untreated ore. Here the student is taught to forecast the expense of the establishments he muet make; their annnal cost; the cost of miners, employés, machines, material, etc.; and offset these with the result of production, eo endeavoring to solve the problem of making a given mine pay in given circnmstances, by scientific attack, distribution, and general rational economy. Mechanical preparation describes the various accepted methods of reducing maseive ore to a condition either yielding metal or fitting the material for metallurgical processes. Models of stamps, crushers, shaking tables, sluices, etc., are exhibited, with plans and sections of mills, and coal-breakers at home and abroad.

Assaying.

During the third year the student is admitted to the Assay Laboratory, where he is provided with a snitable tahle and a eet of assay apparatus; and where he has accees to crncible and muffle furnaces, and to volumetric apparatns for hullion assay by the wet process. The general principleeas well as the special methods of aesaying are explained in the lecture-room, and at the eame time the ores of the various metals are exhibited and described. The student is then eupplied with suitable material. ores of known composition, and ie required to make assays himself. He first receivee oree of lead, the sulphide, carhonate, and phosphate, which he mixes with the proper fluxes, and heats in the furnace, obtaining a button of lead, which he carefully weighs, thus determining the percentage of metal in the ore. He then determines by cupellation the amonnt of silver in the lead. Silver ores are next given him, at first those which are most easily sssayed, such as mixtures of chloride of silver with quartz; afterwards more complex ores, such as galena, ruby silver ore, mispickel, fahlerz, etc. These he is required to assay both in the crucible and in the scorifier. Ores of gold are next snpplied, auriferous quartz, slates, pyrites, blende, etc., which are assayed hy the most reliable methods. To facilitate the assay of ores of the precious metals a system of weights has heen introdnced, hy which the weight of the silver or gold glohule obtained in the assay ehows at once, without calculation, the number of troy onnces in a ton of ore. The student then passes on to the assay of silver and gold bullion, the former hy Gay Lussac's volumetric method, the latter hy "qnartation" "parting." Ores of tin, antimony, and iron, are then assayed by the dry methods, when the conrse is completed. Each student thus executes two or three hnndred assays himself, nnder the immediate supervision of the instructor.

Metallurgy.

The Metallurgical course includes lectures on the preparation of fuels, construction of furnaces, the mannfacture of metals, projets and estimates for the erection of metallurgical works. The lectures cover a period of two years, and discuss in detail the methods in nse in the best establishments in this conntry and in Enrope for the working of ores, with practical details of charges, labor, and oost of erection obtained from the most authentic sonrces. Special attention is given to ores of this conntry which are difficult to treat, and to the solution of practical problems which are likely to occur. The lectures are illustrated hy models, drawings of furnaces, and by collections of metallurgical products obtained from works in this country and Europe.

The plan of instruction inclndes lectures and recitations; practice in the chemical, mineralogical, blow-pipe, and metsllurgical laboratories; projects, estimates and drawings for the establishment of mines, and for the construction of metallurgical and chemical works; reports on mines, industrial establishments and field geology. The degrees of C. E., M. E. and Ph. B. are given on the completion of the course, according to the special branches of stndy pnrsued hy the student.

THE CINCINNATI MINE in Kelsey District, El Dorado Connty, Cal., snd owned by parties in this city, has, we are informed, developed wonderfully of late. The ledge at 100 feet, ehows from 8 to 10 feet of good vein matter, yielding at mill $45 per ton. One hundred tons are now being crushed at a custom mill near hy, and drifts north and south in the mine are being run night and day. Mr. Geo. A. Gates, the Superintendent writes very enconragingly and is driving the work ahead with energy. He hopes from present prospects to pay a dividend soon. The prospects for so young a mine are flattering.

THE NEW DISTRICT near Elko, has been named the "Cornucopia," and the rush there is great. Numhers of men have left other camps for the new district, and the reports of exceedingly rich rock having heen found are many. Gold float is said to be very ahundant in the vicinity of the camp, and several epecimens brought in exceed in richness anything ever fonnd in the county hefore. The formation is granite, and the surrounding country shows no evidence of volcanio eruptions.

THE OCHOCHO MINES, about which eo mnch has heen written, are not turning ont as well as was expected, more particularly on account of want of water. A correspondent of an Oregon paper, who has been to the mines, says the men are fast leaving for other localities. Some prospecting is, however, still going on. There is a rumor that silver has been discovered in the vicinity of the mines.

THE Virginia and Gold Hill Water Works have completed their work, and the water ie now rnnning into the cities, much to the delight of the inhabitants. The highest presenre on the pipe is 1,720 feet—figures which will astonish engineers all over the world. We will shortly give a complete deecription of the works.

THE McMAHON Mining Company at Schell Creek, are going to huy or have bought a mill to pnt up at their mine. The mill belonged to the Pennsylvania Mining Company at Silver Cañon, about 8 miles from Schellhourue, and will he moved over. It is a heavy, 5 stamp mill with Blake crusher, and will work 10 tons per day.

QUICKSILVER has gone up, or rather been put up, to $1.10 per pound, higher than it has ever been before, to our recollection. This is pretty rough on the miners, but unfortnnately they mnst have the metal and must pay the price asked hy holders.

Description of a New Species of Alcyonoid Polyp.

BY ROBERT E. C. STEARNS.

At a meeting of the California Academy of Sciences, held on the third day of February, 1873, a paper was resd by me, entitled "Remarks on a New Alcyonoid Polyp," from Burrad's Inlet,"* in which I gave a resumé of the discussions, published notices, etc., in this country and in Europe, arising from the examination hy seversl naturalists of certain "switch"-like forms, which had heen recognized by different parties from the Gulf of Georgia, more particularly from Burrard's Inlet in said gulf, several specimens of said "switches" being in the Mnseum of the California Acsdemy.

These "switches" or rods were referred by Dr. Gray, of the British Musenm, to his Genus "Osteocells," and hy Mr. Sclater's correspondent stated to belong to "a sort of fish;" but by the majority of scientific gentlemen who had seen these "switches," they were regarded as helonging to a species of Alcyonoid Polyp; I expressed the belief that they belonged to a species of *Umbellularia*.

At a meeting of the California Academy, held on the evening of Aug. 4th, 1873, Dr. Jss. Blake presented a specimen of the polyp, of which these so-called switches are the axes, which had been sent to him from the Gulf of Georgia, by his friend Captain Doane, this specimen was one of six or seven sent at the same time, all of which were in a tolerable state of preservation, though as might have been anticipated the more delicate tissnes of the polyps are somewhat decomposed, snd some of the specimens are in some plsces lacerated; they all are however sufficiently perfect to determine their true position, and ehow, that the switches are as was snpposed the supporting stalks or axee of an an alcyonoid polyp "related or pertaining to the group *Pennatulidæ*."

On the day after the meeting of the Academy (August 5th,) through the courtesy of Dr. Blake I wss permitted to inspect the other specimens, snd said from examination have written the following description.

Genus Pavonaria, Cuvier.

Pavonaria Blakei, n. s.

Polyp-mass or polypidom of a flesh or pink color, linear elongate, attenuate; polypiferous portion ahont three-fourths of entire length, rounded oval to ovate-elliptic in cross section, and from three fourths to one inch in greatest diameter, flatly tapering toward the tip, as well as decreasing in the opposite direction to where the polypiferous rows terminate or become obsolete; from this latter point to the heginning of the hase or root a portion of the polypidom equal to about one-sixth of its entire length is quite slender being only ahout twice the diamater of the naked axis, and the surface quite smooth; said portion as well as the base is round (in cross section); the hasal part is from one-niuth to one-eleventh of the entire length, and ahout one inch in diameter, with the surface longitudinally wrinkled, or contracted, presenting a ridged or fihrous appearance.

Style or axis, long, slender, white, hard, bony, somewhat polished, abont three-sixteenths of an inch in diameter in the thickest part, tapering gradually toward the tip, and attenuated, with eurface roughened towards the basal extremity; enclosed in the polyp mass or polypidom the axis is central from the base to where the polyp-rows begin, when it eoon becomes marginal or lateral forming a prominent rounded edge (free from polyps) on one side of the polypiferous portion of the whole; from near the sides of the axial edge the polyp-rows start and run ohliquely upward to the opposite side where they nearly or qnite meet, presenting when that side ie observed from above, a concentric chevron or Λ like arrangement; the more conepicuons polyp-rows ehow from nine to fonrteen polyps with occasional intermediate rows of three or more polype.

The length of the most perfect of Dr. Blake's specimens was eixty-six (66) inchee, of which, commencing at the top, a length of forty-eight and a quarter (48¼) inches was occupied by the polyp-rows, which numbered two hundred and forty-five (245) or twice that number when both sides or arms of the chevron or Λ is considered; the number of polype in each row, waa in this specimen, from eight (8) to (11) with occasional intermediate short rows of from three (3) to seven (7); estimating ten to the row, thie epecimen exhibited ahout *five thousand* polyps, all of which, as well as the polyps in the other specimens, were filled with diminntive ova of an orange color. In the next section of this specimen the length hetween the last polyp row and the swell of the hase or root, is eleven (11¼) inches, thence to the termination of the hase, six (6) inchee.

The average dimensions of thirty-six (36) of the axee in the mnseum of the California Academy is five feet eix and one-third inches in length, and the diameter of the largest nine thirty-seconds of an inch; diameter of smallest epecimen one-eixteenth of an inch.

In connection with the ahove description, some allowance should be made for the contraction and injury of the tissues hy the alcohol in which the specimene were placed after they reached this city.

Additional specimens of the ahove species have been received from J. S. Lawson Esq U. S. Coast Survey, hy Geo. Davidson, Esq., Preeident of the Academy from the same locality.

*Vide Procesdings Csl. Acsd. Scisnces, Vol. V, Psrt I, pp. 7—12.

Pope Valley Quicksilver Mines.

On a recent tour through Napa county, one of the gentlemen connected with onr office took occasion to visit tho several mining companies' works located in Pope Valley, and furnishes some items about them together with a map. The locality is reached by stage from St. Helens over a good mountain road and is about 18 miles distant from the latter place. It is the east end of the cinnabar belt that can be tracked from here up to the Geysers. Many s good mine will probably yet bo discovered on this line, and lively prospecting is going on. There are several creeks in the immediate neighborhood, and in fact enough water is taken out of some of the claims to supply the necessary wants in the water line. Timber, which is quite an item about the furnaces, is found in the adjoining mountains, and but for the price of hauling the same, would be equally as convenient as the water is. The cinnabsr belt is continuons from Pope Valley to the Geysers. There are soda springs on the Pope Valley end and indications of them on the whole line. The distance from Pope Valley to the Geysers, on the line of the belt, is about 24 miles.

By reference to the accompanying map a good idea may be had of the relative location of the different mines in this district, of which the

Phoenix Mine

Is the principal one. This mine averages 30 flasks of metal per week out of about 125 tons of ore. The shaft is down 150 feet. The main tunnel is in 1,100 feet and the lower tunnel runs back in the mountain 600 feet on the lowest level of the shaft. There is also a tunnel running forward 175 feet from the bottom of the main shaft. Most of the ore is taken out of the "Antone Spout" nearly at the end of the main tunnel; vein averages from 3 to 18 feet thick. It has been taken out about 60 feet down, leaving 90 feet to get ont before the lower level is reached.

They have enough ore in sight to run at the present capacity for about two years. The mine is cleaned up now to get at the heavy body of ore below the lower level of the main shaft. Heavier machinery will be required to take ont the better ore below. To drain the mine from the main shaft a No. 8 Blake pump is kept running constantly, which discharges about 5,000 gallons per hour. This amount is largely increased during "flood times" or rainy seasons. The mine is well ventilated throughout. There are 51 men employed at present, as follows: 8 work on waste rock; 6 on the furnace; 9 in the adobe yard; 2 on the boiler; 2 on the pumps; 1 engineer at the head of the shaft; 1 blacksmith; 3 carmen; 2 in wood yard; 10 miners; 2 men to wheel ore; 1 foreman; 1 book-keeper; 2 men in kitchen; and 1 superintendent.

The mine has been successfully worked for over 3 years. The main office is at Napa city. They are using 5 cords of wood per day at this season at $4 per cord. They are now running a tunnel from the hillside about 60 feet below the main tunnel, and have good prospects of striking a rich body of ore. They expect to largely increase the present yield. The mine is in Pope Valley, 18 miles from St. Helena over a fair grade wagon road and about 8 miles in a direct line to Calistoga. A road from Knoxville passing the camp to Calistoga is in contemplation, which if carried out would greatly facilitate transportation. A post office is now established at the mine with J. H. Cowan as postmaster; stages arrive tri-weekly. C. Langley and Co. are San Francisco agents for the sale of the quicksilver, and a ready sale is easily had.

The furnace is the Knox & Osborne patent, the second one of the kind ever built, and since the last re-modeling gives very good satisfaction. The machinery consists of one boiler with a Blake pump for feeding; one 12 horse power pumping engine at top of shaft. Pump in shaft and also a steam pump to use in sinking an air shaft. One 12-horse power engine for driving the Root Blower at the furnace. George Fellows is Superindent; George Porter, underground foreman. Wm. P. Cook, engineer at main shaft; Morris Mehon, foroman at furnace; and J. H. Cowan, book-keeper.

The Aetna Mining Co.,

Formed from the Silver Bow, Valley and Pope mines, is not doing much at present, they being engaged puttiug in a new engine, but they expect to start up the furnace this month. They have enough ore and adobes to supply the furnace for a month. These three mines are not very much developed as yet, but the ore taken out so far proves good. The Knox and Osborne furnace is used here also.

The Silver Bow, belonging to the Aetna Mining Co., is the most elevated claim, and machinery is used to force up the necessary water. The main tunnel is in over 200 feet. It is worked by Chinamen, who take out very good ore.

The Valley and Pope claims, which also form part of the Aetna Mining Co., are not shown on the map, they being located further down in the valley.

The Washington Mine

Is not worked by the owners but by D. Patten, former superintendent of the Phœnix. The working is done on a very cheap plan. All the ore is being taken from a surface cut on the hillside, so the rock requires no blasting. Few hands are employed. No systematic method of working is in vogue, as the lessee wants of course to get out as much ore as possible, and as cheap as possible. Dr. Stillwagon of Naps, is the principal owner. Taking out ore and reducing it costs about $4, only at this mine. The capacity is about 30 flasks of quicksilver per month from 100 tons of ore. The main tunnel is in 279 feet, 44 feet from surface. The ore-bearing ground measures 23 feet on bottom of this tunnel. Only six men are employed, two in the mine, two in the adobe yard, and two in the furnace. The mine is at present being worked without machinery. They can sink 80 feet deeper at a reasonable expense, without pumping. A drift is run 32 feet west and 60 feet east from the main tunnel, showing good ore all through. The situation of the mine can be seen by reference to the accompanying map. Langley & Co., also have the agency for the sale of the product of this mine. The furnace is the same as that at Almaden with a section of iron condensers attached. It is charged 10 times per month, and 10 tons at a charge. They have a good spring on the ground and a creek running through, well supplied with trout. There are 180 acres of timber land belonging to the mine. It will be seen from the location and cheap working of this mine, that the cost of extracting the metal is much less than at the others, and consequently it pays a fine profit.

The Red Hill mine is partly developed, but not worked at present. D. Patten is the principal owner. Several tunnels have been run from 120 to 180 feet in length, all showing good ore.

The Chapman Expedition which has been engaged in exploring the valley of the Colorado on the Eastern base of the Lower California

POPE VALLEY QUICKSILVER REGION.

Mountsins has been heard from. Captsin Bsiley, who has returned, has furnished the San Diego *Union* with a few items in relation to the progress of the survey. They first proceeded from the base of the mountains of Lower California to the overflowed banks of New River, or Hardy's Colorado. This natural irrigating canal, bearing the back water of the Colorado to the depressed basin of the Desert, is below the level of the sea. Along the southwest side of this canal runs a sandy ridge. Crossing this ridge there is found, not many leagues below the Mexican boundary line, a lagoon, filled with salt water connected by means of a slough with the head of the Gulf of California. The problem was to ascertain whether a practical plan could be devised for connecting this lagoon with the New River canal, so as to flood the greater portion of the desert with salt water and form a lake. This, it is found, can be done at a comparatively small cost. There is a place where the distance between the lagoon and this desert canal is quite short, and the cut required to be made may be easily accomplished, and, at a slight cost, kept open. Further details will no doubt shortly come to hand.

The Artesian Shaft at Virginia, upon which no work has been done for a month or so, has been started up again. The work is being done by a method described by us some time since. Holes are bored as deep as possible and then filled in with sand. In putting in a blast the sand is cleaned out for eight or ten feet, and the blast put in and fired. It is quite a saving of time, as the men can work faster than they can by drilling and blasting alternately. The holes being already drilled and filled with sand, all that is then to be done is to take out a few feet of sand, blast, remove the debris and repeat the same operation. In the shaft spoken of, only one more hole is to be drilled of the several which mark out the shape of the shaft.

Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last, Prof. J. D. Whitney in the chair. Messrs. David J. Staples, Solomon Goldsmith, Alfred Wheeler, R. H. Plummer and Albert Williams Jr., were elected resident members. Donations were received as follows: A full set of the publications of the State Geological Survey of California, presented by the State through Governor Booth. Specimens of fish, sometimes called the "King of the Herrings," caught off the Farallone Islands, presented by Mr. C. P. Dameron. Mr. C. D. Gibbes presented the nest and eggs of marsh wren, (*Troglodytes Palustris.*) These nests are abundant throughout the swamp lands; they are purse-shaped and composed of flexible grasses ingeniously woven together. They are suspended three or four feet from the ground attached, to the tules by being woven around them. A small entrance is left near the top and the nest is lined with soft grasses and down from the plant known as the "cat-tail." The eggs are of a light-brown, mahogany color, with darker dashes varying in intensity of shade. Although Mr. Gibbes had seen many of the nests, this is the only one in which he had discovered eggs.

Dr. Blake presented to the Academy a specimen of *Pennatula*, which had been taken in the Gulf of Georgia in about seven fathoms of water. A paper was read by W. A. Goodyear, of the State Geological Survey, on the "Situation and Altitude of Mount Whitney," the substance of which we will give in our next issue.

James R. Smedberg, Consulting Engineer of the San Francisco Gas Light Company, announced that the work entitled "A Synopsis of British Gas Lighting," upon which he has been engaged for five years, is now in press, and will be issued in November. This new work is one which has been expected anxiously for some time by parties interested in the subject. It comprises the essence of the *London Journal of Gas Lighting*, from February 10th, 1849, to December 31st, 1868, with the monographs read before the British and North British Associations of Gas Managers between the latter date and November 1st, 1873. There is added a zincograph of the latest form of that valuable American contribution to the art, the Sabbaton Multitubular Condenser. Part 1. (700 pages and 170 illustrations) sets forth the whole argument of Gas Lighting. Part II (250 pages and 35 illustrations) gives abstracts of 900 patents in this art and its allied industries. The whole work is quite a comprehensive one, and the illustrations, some of which were exhibited, are gotten up in excellent style. Mr. Bosqui is publishing agent, which is sufficient guarantee of the typographical appearance of the book. All the work on the publication will be done in this State.

Concentrating Ores—We see by the Salt Lake papers that a gentleman has come over from England to superintend the erection of concentrating machinery for the Utah Silver Mining Co. of Utah. Mining operations will be suspended during the erection of the machinery, but there are 2,000 tons of ore on the dump ready for working. If a success is made of this experiment, which is highly probable, the example will be followed by many other mining companies in Utah. More attention is now being paid to the concentration of ores than ever before on this coast.

The Owyhee mines are turning out remarkably well this season, and the people there think the camp is not a permanent one. Mining machinery is being brought in and business is brisk. Workmen are reported to be scarce.

Patents & Inventions.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents]

By Special Dispatch, Dated Washington, D. C., August 5th, 1873.

For Week Ending July 22n, 1873.

Candle Guard.—Benjamin Morgan, S. F., Cal.

Spring Joint for Watch Cases.—John Gordon, S. F., Cal.

Scroll Sawing Machine.—Marquard Hansen, S. F., Cal.

Blast Furnace Breast-Plate.—Robert A. Fisher, S. F., Cal.

Tauss Bridge.—Alfred Bannister, S. F., Cal.

Tuck Marker.—Frederick L. Tileston, S. F., Cal.

Shoemaker Pincers.—Wm. H. Hanna, Chico, Cal.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Circular Ironclads.

For many years the idea of constructing a perfectly circular ironclad has been advocated, but it has remained for Admiral Popoff, of the Russian navy, to put in practice what others had only suggested. The new type of war vessel is called, in his honor, the "Popoffka." The first specimen of the class was lately launched at the navy yard at Nicolaef, and is called the Novgorod. Other vessels, from the same plans, are now being constructed.

The "Popofika" is, in effect, a Monitor, with the distinguishing and most valuable qualities of the latter carried still further to completion. As compared with our typical Monitor, the "Popoffka" has many advantages. To make these more apparent, compare a vessel of each build of the same displacement, say 1,535 ft.' This size of "Popoffka" will be 90 ft. in diameter, 9 ft. in draught, with armor 10 in. in thickness and carrying 2 guns of 11 in. caliber, as against the following figures for the same size of Monitor: Length, 200 ft.; beam, 40 ft.; draught, 11 ft.; thickness of plating, 5 in.; guns, 2 of 9 in. caliber. The "Popoffka," therefore, gains in these particulars: 2 ft. less draught, armor of double thickness and guns of much greater size. It is further stated, that the cost of a "Popoffka" is only two-thirds that of a Monitor of equal size. The former has also immense advantage in increase in resisting strength and enlargement of available storage room, from the peculiarities of construction.

Having enumerated the easily understood good points of the new vessel, we turn to the question of comparative speed and seaworthiness. It appears from reports of a trial trip of the Novgorod that 6 knots were made on half pressure. Complete turns were made in 1 min. 19 secs. without movement forward. In rough water there was no plowing up; the water slipped by her sides quite easily. Now it is a notorious fact that our Monitors do plow dreadfully, and are only expected to make from 7 to 8 knots per hour at full steam. So even in this direction, very unexpectedly, the comparison is still in favor of the Russian model.

The Novgorod has twelve keels of 8 in. depth, and six pairs of compound screw engines, having their shafts arranged parallel to the lines of the keels. To turn quickly, the three screws on one side are slowed, stopped or backed, while the three on the other side continue to revolve.

The Napa Gold Mine, according to the Calistoga *Tribune*, has $10,000 worth of ore on the dumps; some of it has been worked in this city, and yields $38 per ton. It is stated that it can be worked at the mine for $3.50 per ton. Arrangements have been perfected for the construction of a mill, and 20 men are now a work on the mine.

The Newly Completed Shaft of the Nortonville coal mine will enable the company to increase their production, and employ a larger number of miners. New buildings, bunkers, etc., are to be erected, and a branch railroad track will connect them with the present track.

The El Dorado canal in Baker County, Oregon, is 97 miles long, and supplies a mining country 40 miles in extent. The ditch is paying handsome profits.

Valuable Mineral Deposits.

The Commissioner of the General Land Office, having received a number of communicatione in relation to obtaining title to lands having upon them borax, carbonate of lime, sulphur, etc., etc., has issued the following circular, defining the term, "valuahle mineral deposits," nnder the Mining Law of May 10th, 1872:

Department of the Interior, General Land Office, Washington, D. C. July 15, 1873.

GENTLEMEN: I have had under consideration a number of letters, mostly from California, wherein inquiries are msde as to the proper course to pursue to obtain title to public lands containing valuable deposits of borax, carhonate and nitrate of soda, sulphur, alum and asphalt. Among them is one from the Nevada Consolidated Borax Company, from which it appears that this company intends to commence the utilization of the alkaline plains of Nevada.

The first section of the act of Congress approved May 10, 1872, reads as followe: "That ALL *valuable mineral deposits* in lands belonging to the United States, both surveyed and nnsurveyed, are hereby declared to he free snd open to exploration and purchase, and the lands in which they are found to occnpation and purchase," etc.

The second section declares "that mining claims upon veine or lodes of quartz, or other rock, in place-bearing gold, silver, cinnabar, lead, tin, copper, or *other valuable deposits*, heretofore located," etc.

The sixth section refers to "a patent for any land claimed and located for *valuable deposits*.

It will be observed that in the first section of the act the expreesion "valuahle *mineral* deposits" is employed, while in the second and sixth sections the language is, "valuahle deposits." Allowing, however, that it was the intention of the law-makere by tbis act to dispose of "valuable *mineral* deposits," the question becomes tnis, "What is a valuable mineral deposit?"

The meaning of the word valuable need not be discussed. Anything a pereon is willing to give money for, or that is nseful or precions, or that has merchantable qualities, is valuahle.

The word deposit has always been construed hy thie Office to be a general term, embracing veins, lodes, ledges, placers and all other forms in which valuable metals have ever hcen discovered.

In the eenee in which the term mineral was used hy Congress, it seems difficult to find a definition that will emhrace what mineralogists agree sbould he included. The several authorities consulted in tbis connection seem to find it an eaeier task to determine what is not, than what is, mineral. However, in all the works on mineralogy that have come under my notice, horax, nitrate and carhonate of soda, sulphur, alum and asphalt are classified and discussed as minerals.

Alger's edition of Phillip's Mineralogy speaks of "the crust of the glohe as consisting chiefly of earths and earthy minerals." Between earths and minerals there is a clear line of demarkation, and, tbough difficult to express in a few words, chemical composition and crystalization are the principal means of tracing the distinction.

Webster seems to he the most accurate in his definition of a mineral, for he recognizes chemical composition as the important consideration. He defines a mineral to he "any inorganic species having a definite chemical composition."

From a careful examination of this matter, the conclusion I reach as to what constitutes "a valuable miueral depoeit" is this:

That whatever is recognized as a mineral hy the standard antborities on the subject, where the same is found in quantity and quality to render the land sought to be patented more vsluable on tbis account than for purposes of agriculture, should be treated hy this Office as coming within the purview of the mining act of May 10, 1872.

The language of the statute is so comprehensive, and capable of such liheral construction, that I cannot avoid the conclusion that Congress intended it as a general mining law, "to promote the development of the mining resources of the United States," and to afford a method whereby parties holding the possessory right under local laws and regulations could secure title to tracts containing valnable accretions or deposits of mineral snbstances, except where a special law might intervene, reserving from ssle, or regulating the disposal, of particularly specified mineral-bearing lands.

To the several inquiries in the letters referred to, I therefore reply that lands valnahle on account of borax, carbonate of soda, nitrate of soda, sulphur, alum and asphalt, ae well as "all valuahle mineral deposits," may be applied for and patented under the provisions of the mining act of May 10, 1872.

In case an application should he presented to you for a survey of land valuahle for other minerals than those specified herein and in the act itself, you will first refer the questiou to this Offio', iu order that applicants may he saved the expenee of applying for lands that may be reserved by a special act of Congress.

It will be observed that the mineral-producing lands are divided into two classes—the one class embracee lauds where the mineral matter is within "rock in place," or, geologically apeakiug, "*in situ*;" and the second includes placere and all forms of deposite excepting those in "rock in place."

In this connection, I deem it a matter of importance to give the construction this Office placea upon the expression, "vein or lode of quartz or other rock in place," to prevent mistakes in locating the two classes of mines referred to, thereby saving to claimants considerable expense and delay.

In geology and among miners, veins or lodes imply generally an aggregation of mineral matter found in the fissnres of the rocks which inclose it, but are of great variety, veins differing very much in their formation and appearance. Lode is a term in general use among the tinminers of Cornwall, and was introduced on the Pacific coast by emigrants from the Cornish mines, and signifies a fissure filled either by metallic or earthy matter.

In several of the mining-districts the terms lead and ledge are employed in the local regulations concerning mines. Lead is used to convey the same idea as lode, while ledge would seem to indicate a layer or stratum of mineral interposed between a course or ridge of rocks.

Veins may be either sedimentary, plutonic or segregated. or of infiltration or attrition, depending upon the peculiar formation or the mode of occurrence of tbe mineral deposit. There is also another form of deposit different from either of those mentioned above, called *contact deposit*.

European miners mention still others, called in England "floors," in Germany "Stockwerke," and a form of deposit known as "Fahlband." These latter are, more properly speaking, ore-bearing helte, irregular in their dimensions, but presenting a certain degree of parallelism with each other. Similar in some respects to the Fahlhands are the metalliferous zones, or "amygdaloidal bands," which are said to exist on Mount Lincoln and Mount Bross, Colorado.

However, if the question were raised, neither of the forms of deposit known as contact doposit, Fahlhands, or segregated veins could be accepted as true metalliferous veins, nor could it frequently he made to appear, without expensive excavation, whether the metal in the mine for which a patent is sought occurs in the form of a true vein or not.

But there is no reason for supposing that the terms were employed in their strict geological signification. The plain object of the law ie to dispose of the mineral lands of the United States for money-value, and whatever form of deposit can he embraced in the general phrase "vein or lode of quartz, or other rock in place," must he sold at the rate of five dollare per acre.

It is evidently the policy of the Government to include as much land as possible nuder the designation, for the reason that, as the most valuahle metals and minerals occur in the several vein-formations, it is desirable that the lands whereiu they are discovered should be sold in limited quantitics, thereby preventing the few from monopolizing large tracte, which ought to remain open to all for exploration and development; and for the further reason that the Governmeut derives a larger revenue from the sale of lands of this description.

In fine, I include in the first class sll lands wherein the mineral matter is contained in veine or ledges, occuping the original hahitat or location of the metal or mineral; whether in true or false veins, in zones, in pockets, or in the several other forms in which minerals are found in the ORIGINAL ROCK, whether the gangue, or matrix, is disintegrated at the surface or not.

You will please give puhlicity to this communication where it can be done without expense to the Government.

Very respectfully, your ohedient servant,

WILLIS DRUMMOND,
Commissioner.

To Surveyors-General and Registers and Receivers.

Weights of the Different Metals or Ores to the Cubic Foot.

Metals and Ores.	*Weight.*
Gold, native	1,250
Silver, native	643.75

To find the weight of any of the ahove ores in six feet of the vein, mnltiply the number opposite the same ore in the table hy the number of cuhic feet in a fathom, and the weight per fathom is plainly shown, if eolid, and if not, allowances should be made for cavities.

NOTE.—A vein of ore eix feet square (six feet long and six feet high) and one inch thick will measure three cubic feet, therefore, to find the cubic feet, multiply the thickness in inchee by three.—*H. B. Grose, in Lincoln Co.* (*Col.*) *Sentinel.*

A Plea for "The Civil Damages Act."

EDS. PRESS:—Whatever douhts there may he with regard to the propriety of an article on this suhject in your paper, there can he no question of the grave importance of its consideration to the prosperity and well-being of the people in the times to come. When questions of tbis nature demand our attention, it is not only cowardly, but even criminal, to ignore them hecause they are unpopular. There is something nobler than the time-serviug spirit which "does as Rome does," and glides gracefully into almost every grade of society, apparently finding them alike congenial, for the sake of the lo aves and fishes. And it is by no means flattering to those who love good order and decency, that they *passively* allow their intelligence to be controlled by those who notoriously hreed nearly all the disorders that disturh society.

The Legislatures of the States of Illinois, Ohio and New York, have enacted a law by which any person injured "in person, property, or in means of support by any intoxicated person, or in consequence of intoxication, may recover damagee therefor from the person, who, hy selling or otherwise furnishing the liquor, caused the intoxication." And as this law compels the one who engenders intoxication to make good the damages done by the drunkard, and allows the injured wife, or parent, or child, to sue in a civil action therefor, it is called The Civil Damages Act. In some other places, laws, in restraint of intemperance, have aimed to make intoxication a crime or misdemeanor, to be prosecuted hy puhlic officers, and while there can he no douht that drunkenness is a crime, and as deserving of punishment as some others that are found in the catalogue, yet the law that made it so, failed to mcet the approbation of the people, and hence failed to accomplish its purpose. No law is ever stronger than the public sentiment behind it; and though made hy the angels, it is powerless to effect any good thing among men, unless they approve of it, and, ahove all, enforce it.

But it is helieved and confidently expected that the Civil Damages Act, as it is termed, will not only accomphsh the great resnlt aimed at, but will also meet the approhation of every thinking man and women throughout the land, It is eminently just and proper that there should be such a law in every State; we all feel the need of something of the kind; we constantly see the evil and, too often, criminal results of intoxication, and we know that the responsibility rests somewhere, and it cannot be said that it rests wholly with the drunkard. This new law, then, is only a happy amendment to the old one. When the drunkard transgresses the law he is responsible for his crime, the same as nnder the old law, but for the damages that he does to any one, "in person, property or means of support," the one is responsible who, by selling or otherwise furnishing the liquor, caused the intoxicatiou.

Superficially viewed, the civil dsmages act might seem, to some, unduly severe upon those who vend intoxicating liquors; hut the fact is, it conld not possibly he milder, and serve to accomplish any good purpose, Little as saloon keepere deserve anything favorable from the law and public sentiment, still it would he most unwise, as well as unjust, to infringe upon any of their personal rights. That this law does not do so, will appear, I think, from the following considerations:

1. It is nndeniable that most of the crimes, disorders and indecencies tbat disturb society owe their origin directly or indirectly to intoxication. All unseemly domestic brawls and cruelties epring from the same fountain hcad, so prolific of evil. In short, it ie a school for crime, and does not fail in the fulness of time to graduate CRIMINALS. These are facts that we all know, and, as they are indisputable, it is useless to enlarge upon them. The qnestion naturally arises, is there no remedy? Must the land always groan under thie miasma, with no prospect of even a far-off relief? Surely the means employed must he harsh indeed, if they are not justified by the magnitude of the evil.

2. The object of the law is not to prohihit the sale of intoxicating liquors, but to prevent drnnkenness. To fleece a man of his money while in a state of intoxication—the money which his wife and helpless children are perhaps starving for, ia only robbery, view it ae we may. And is it more than justice to hold the one who does so responsible for the damagea that his victim may do, while in a state of insanity?

3. Thie law infringes on no man'a rights. In the eye of the law, drunkenness is a crime, and certainly those who engender it by furnishing the liquor are accessories to the crime, and are therefore deserving of punishment. Can that law be called severe which only aims to compel the vender of intoxicating liquors to stop before his victim has lost all sense of responsibility? Surely no! A thousand times no, when we consider the countless evils that are caueed hy selling just a few more drinke. Can the paltry sum of money gained by the vender of liquors be weighed against the crimee and disordere that are caused by drnnkenness? From our penitentiaries and jails, our poor-houees and hospitals, the anewer comes back in thnnder tonee, No! No!

But the ohject of this article is not so mnch to discnss, as to call attention to the new law, adopted in three of the greatest States of the East. Your paper, Messrs. Editors, circulates among that class of people to whom we must look for hringing about this mnch needed reform. And I ask each one of your readers, personally, why we should not have the Civil Damages Act in California? Think of it seriously, as it deserves, and then let actions he your conclusion. T. C. MOFARLANN,

Monterey, Cal., July 18, 1873.

The Public Domain.

An officially prepared statement has been msde in contradiction of the recent puhlication, stating, that including sales already made, reservations, grants hy Congress and other disposition of public land, tbe Government has already parted with four million acres more than the whole area of arable lands in the United States, and that here were no tillable lands left for eettlers. The official statement recounts, that as about a billion and a quarter of acres of the public domain, much of which hse not yet been explored, remaine to he surveyed, there are no reliahle data hy which the correctness or incorrectness of the estimatee can he determined. It is impossible to ascertain, even approximately, the number of acree covered by water, or included in mountain ranges or deserts, prior to an actual survey of thie immense area, and therefore no reliance can he placed on the statement of estimates alluded to. Grante and concessions to corporations, and reservations for Indians, etc., being for lands in places stated, of course include the water surface, mountain ranges, desert, marshes and all kinds of untillable lands, as in case of swamp lands. The waste land included in these grants and reservations having already heen deducted as uncultivatable lands, ehould not have been counted in making up lands granted and reserved, or, if so counted, proper allowance should have heen made. Grants to railroads, particularly to those known as Pacific roads, are through waste and mountain districts, where the percentage of unproductive lands is much greater than in other portions of the United States; therefore a much larger deduction should be made for waste lands in considering the grante to these roads. Allowance should also be made for Indian reservations which will ultimately revert to the United States, as well ae for cancelled homestead and other entries, and also for unproductive lands included in tracts held by private partiee in the older States, and grants heretofore made hy Government in States containing public lands, and in grants of sixteenth and thirty-sixth sections for school purposes. The aggregate of these additional items will probably amount to not less than two hundred millions of acres; so that inetead of the United States having disposed of four million acres of arable land more than it owns, it prohahly has left for the disposal of settlers, after making all proper deductions, between three hundred million and four hundred million acres.

Iron Pyrites and Fire Arms.

The connection of iron pyrites with fire-arms deserves to he briefly noticed. When Edward IV. landed at Ravenspur, in 1471, hringing with him 300 Flemings armed with gnns, the latter were simply iron tuhes with a touch-hole, mounted on a straight stock, and fired by meane of a match. The accidents occasioned by carrying lighted matches near gunpowder very evidently caused some now nnknown genius to imagine a method of producing fire when it was wanted only. Pyrites, or the "fire etone," was the substance first tried. A piece of iron pyrites was fixed opposite to the open touchhole, and when sparks were required it was rubbed with a file attached to the barrel. In the time of Henry VIII. a very ingenious contrivance was imagined by another forgotten genius, in order to get rid of the tronhlesome file. The latter was then replaced by a wheel and spring, coincident with the first appearance of a trigger. When the trigger was pulled, the wheel, previously wound up hy a key, spnn round with great velocity in contact with tbe pyrites, and produced a regular stream of sparks. This was an important innovation, and apears to have answered the purpose tolerably, until some period in the reign of Charles II., when flint was hinted at as a substitute for pyritee. The flint lock is supposed to have heen invented in the Netherlands; it was generally adopted about 1692, in the reign of William III., when all mention of iron pyritee for fire-arms had totally dieappeared. In the year 1589, when a large deposit of pyrites was found near the Seefen, the Duke Julius, of Brunswick, caused it to be collected, and formed it himself into the necessary ehape for the fire-arms of the period. In doing ao, weare informed hy Beckmann, the duke "often bruised his fingers, and wae adviaed by his physicians not to expose himself to the sulphurous vapor emitted by that snbstance."

FISH RAISING.—At Grass Valley, 17 miles north of Austin, Nevada, on Angust 17th, 1869, Messrs Riotte, Lane and Callahan, put 73 yearling and half yearling trout in a small stream lese than three mileein length. Visiting this stream recently, Messra Riotte of thie city and, Wright of Sacramento, took out over 40 pounde of tront in two hours. An instance like thie ought to encourage others to try raising fish as it is very little trouble and donhly repays a trial.

THE PIONEER Mill in Silver City, Nev.,. has heen thoroughly overhauled and repaired.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared to have them constructed in the most perfect manner and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the apperiure and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others They bring the pulp so constantly add perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and setlers for themselves, at the office, 229 Fremont Street, San Francisco

DIVIDEND NOTICE.

The Farmers and Mechanics Bank of Savings.

The Farmers and Mechanics Bank of Savings has declared a dividend for the half year ending June 30th, 1873, at the rate of ten per cent. per annum on term deposits, eight per cent. per annum on class one, ordinary deposits, and six per cent. on class two, ordinary deposits, free of Federal Tax. Payable on and after July 14th, 1873. By order.

jy19-1m G. M. CONDEE, Cashier.

French Savings and Loan Society,

411 Bush street, above Kearny..... SAN FRANCISCO.

4v27tf G. MAHE, Director.

AXLE GREASE.

To Farmers, Teamsters and Others.

Your attention is called to the very superior AXLE GREASE manufactured by us for over 18 years.

Recent improvements in the chemical arrangement of the lubricants used in its manufacture render its use as serviceable on the lightest buggy as on the heaviest team.

The extensive demand for the H. & L. Axle Greaee has enabled the proprietors to reduce its price to as low a rate as any of the inferior compounds, which are continually being forced upon the market.

See that the trade-mark (H. & L.) is on the red cover of the package, and take no other.

HUCKS & LAMBERT,

Manufacturers & Sole Proprietors,

SAN FRANCISCO.

Factory.....145 Natoma Street.

Depot.....312 Jackson Street.

BURLEIGH

ROCK DRILLS

—AND—

Air Compressors.

The Burleigh Rock Drills, which have stood the test of five years' constant use at the Hoosac Tunnel, and which are now in use in nearly every State in the Union, as well as in Europe and South America, are unequaled in efficiency and economy by any other Drilling Machine. They are of various sizes, and equally well adapted to Tunneling, Shafting, Open Cut or Quarrying, and will drill six to ten inches per minute in granite. They are driven by steam above ground. The Burleigh Air Compressor is the best engine yet devised for furnishing the "air motor" for the many purposes to which it is now being used.

They are to be used on the St. Gothard Tunnel, Switzerland; Tunnel 13 miles long. We refer to the following gentlemen and works:

Gen. Newton, U. S. A..... .....Hell Gate Tunnel, L. I.

Mess. Shanley.....Hoosac Tunnel, Mass.

J. Dutton Steele.....Nesquehoning Tunnel, Pa.

Sidney Dillon.....Fourth Avenue Work, N. Y.

Col. Rochling .....East River Bridge Company, N. Y.

Time Tests the Merits of all Things.

1840 For Over 30 Years, 1873

PERRY DAVIS'

PAIN-KILLER

Has been tested in every variety of climate, and by almost every nation known to Americans. It is the constant companion and inestimable friend of the missionary and the traveler, on the sea or land, and no one should travel on our *Lakes or Rivers without it.*

Since the PAIN-KILLER was first introduced, and met with snch extensive sale, many Liniments, Reliefs, Panaceas, and other Remedies have been offered to the pnblic, but not one of them has attained the truly *enviable standing* of the PAIN-KILLER.

WHY IS THIS SO?

It is becanse DAVIS' PAIN-KILLER is what it claims to be, a Reliever of Pain.

Its Merits are Unsurpassed.

If you are suffering from Internal Pain, Twenty to Thirty Drops in a Little Water will almost instantly cure you. There is nothing to equal it for

Colic, Cramps, Spasms, Heart-burn, Diarrhea, Dysentery, Flax, Wind in the Bowels, Sour Stomach, Dyspepsia, Sick Headnche, &c., &c.

In sections of the country where

Fever and Ague

Prevails, there is no remedy held in greater esteem. Persons traveling should keep it hy them. A few drops, in water, will prevent sickness or howel troubles from change of water.

From foreign countries the calls for PAIN-KILLER are great. It is found to

CURE OHOLERA WHEN ALL OTHER REMEDIES FAIL.

WHEN USED EXTERNALLY, AS A LINIMENT, nothing gives quicker ease in Burns, Cuts, Bruises, Sprains, Stings from Insects, and Scalds. It removes the fire, and the wound heals like ordinary sores. Those suffering with RHEUMATISM, GOUT, or NEURALGIA, if not a positive cure, they find the Pain-Killer gives them relief when no other remedy will.

It Gives Instant Relief from Aching Teeth.

Every House-Keeper should keep it at hand, and apply it on the first attack of any Pain. It will give satisfactory relief, and save hours of suffering.

Do not trifle with yourselves by testing untried remedies. Be sure you call for and get the genuine PAIN-KILLER, as many worthless nostrums are attempted to be sold on the great reputation of this valuable medicine. ☞ Directions accompany each bottle.

PRICE—25 cts., 50 cts., and $1 per hottle.

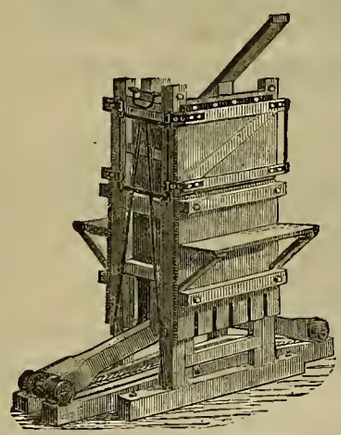
THE EAGLE HAY PRESS.



The above is a correct representation of this remarkable EAGLE HAY PRESS, the invention of J. A. McGillivral, of Illinois, to whom Letters Patent were issued Jan. 10th, 1865, and July 24th, 1866.

Several years were devoted by the patentee to the perfection of this powerful press, and its unprecedented sale in the East induces the proprietors to introduce it into California and the Pacific States.

All who have seen or used these presses pronounce them superior to anything used heretofore. The power is applied by means of two levers, and it will be seen the power increases in ratio to the resistance, as the levers approach a horizontal position the power can scarcely be estimated. It is not only a powerful press, but has the advantage of being cheap, and also simple, therefore not liable to get out of order.

Three men with one horse can bale from TEN TO FIFTEEN TONS PER DAY, each bale weighing 250 to 300 pounds. It obviates all necessity of beating the hay before pressing. On account of its great power it is well adapted for pressing HYDES, RAGS, WOOL OR COTTON. When a bale is pressed and fastened the follower runs down of its own weight, and the bales can be taken out on either side. On April 18th, 1871, this Press was tested at the State Agricultural Hall, Sacramento, and stood the test of a bale of wool, 550 pounds. Reference, Maj. Rob't Beck.

We have added to this Press this season an improvement (patented) which does the stamping, dispensing with men to tread down the hay in the Press, facilitating the operation, and saving much hard work. The additional cost being but $25, paying for itself in labor saved in a week.

These Presses are now manufactured in San Francisco by the

Kimball Car and Carriage Manufact'g Co.,

Who are the Proprietors on the Pacific Coast, and will endeavor to have a supply constantly on hand.

To Capitalists and Hydraulic Miners.

PATENT SELF-CLEANING SLUICE.

This new and useful invention is designed to collect all the gold as fast as it is set free from the dissolving earth, and conduct it into a receptacle of mercury or safety pocket, under lock and key, from whence it may be removed in a few moments, without either checking the flow of water or interfering in the least with the washing.

The invention, if properly placed in our rivers, will also collect the gold which is yearly traveling down their channels, thus affording an annual income with a trifling expense for attending.

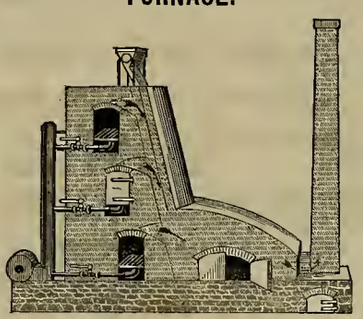
EAGLE IMPROVED CHLORINIZING FURNACE.



For Chlorinizing and Desulphurizing

ALL GOLD AND SILVER ORES SUBJECTED TO AMALGAMATION.

In order to supply the growing demand for cheaper and better processes to work the gold and silver ores of the Pacific Coast, the inventor of this novel Furnace, Mr. THOMAS McGLEW, has, after long experience in treating the base ores by the most improved methods, discovered a more simple and cheaper process than those now in use for roasting ores, and has full confidence in its superior merits over any other processes hitherto invented for chlorinizing ores for amalgamation.

The claims of the inventor are—

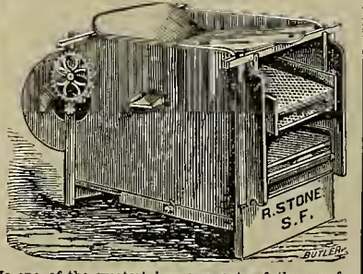
Cheapness in building, cheapness in running, and simplicity of construction—the entire cost not exceeding $3,000.

It is the only Furnace for chlorinizing or desulphurizing where the heat can be regulated to suit all kinds of ores.

Parties wishing circulars and further information in regard to this Roasting Furnace can obtain it by addressing the undersigned at Austin, Nevada.

THOS. McGLEW & CO.
Austin, Nev., July 15, 1873. 6v27-tf

THE PATENT Novelty Mill and Grain Separator



Is one of the greatest improvements of the age for cleaning and separating grain, while it combines all the essential qualities of a First-class Fanning Mill. It also far excels anything that has been invented for the separation of grain. It has been thoroughly tested on all the different kinds of Mixed Grain. It takes out Mustard, Grass Seeds, Barley and Oats, and makes two distinct qualities of wheat if desired.

MILLS FURNISHED AT SHORT NOTICE

At the lowest Market Prices

HALLIDIE'S

Patent Endless Wire Ropeway.

Covered by Numerous U. S. Patents.

IMPORTANT TO

Mining Companies, Civil Engineers, Contractors, Etc.

The system of transporting material, such as Ores, from the mine to the mill, Earths for embankments, Rock from quarries, etc., by means of steel wire rope, has been well tested and found **more economical, advantageoue and reliable** than any other method of transportation; and to the annexed certificates in connection therewith I beg to call the attention of those interested:

EUREKA, Nevada, July 10, 1872.

T. M. MARTIN My dear sir: On your leaving for San Francisco, it gives me great pleasure to hand you my written acceptance of the HALLIDIE TRAMWAY put up by you upon our mine in Freiburg.

It is a perfect success, discharging ten tons of ore per hour with two men's labor. It is perfectly simple in construction, and, as far as I can judge, there is nothing about it to ever get out of order—nothing to wear out. While ours requires but about two thousand five hundred feet of wire rope, I can see no reason why the line could not be extended almost indefinitely with equally happy results. Again, the carrying capacity might be doubled or quadrupled if desired. After several weeks trial upon our mine, the unanimous verdict of all who have seen it is a complete, unquestioned success. If this can be of any service to you, use it in any way you think proper. Very respectfully, O. O. GOODWIN.

EMMA HILL CONSOLIDATED MINING CO., Little Cottonwood, Utah, Superintendent's Office, Sept. 23, 1872.

T. M. MARTIN, ESQ.—SIR: The Ropeway constructed by you (HALLIDIE'S PATENT) for the Emma Hill Consolidated Mining Company, has been built in a most substantial and workmanlike manner, and is at this time in splendid working condition. I most cheerfully accept the work for the Company, and recommend it to others wishing a sure and speedy transit for ores over places impracticable for wagon roads, etc. Respectfully,

L. W. COLBATH, Soperintendent.

"The Vallejo works smoothly with the elevated wire tramway, which carries its load of ore as quietly and easily as if there was no winter or snow in the world.

"Whatever the objections to wire tramways may be on account of their cost, I have seen nothing yet that even approaches them in the facilities they afford for moving ore at all seasons of the year."—Correspondent Utah Mining Journal, Alta, Jan. 8, 1873.

The Vallejo Ropeway.

The Vallejo Tunnel Company's Tramway in Little Cottonwood, built on the HALLIDIE PATENTED PLAN, is a complete success. It is between 2,300 and 2,400 feet in length, and is supported by thirteen stations. The fall in this distance is about 600 feet, and the wire rope, which is three-fourths of an inch in diameter, will safely and easily deliver one hundred tons in six hours. The machinery is automatic, loading and unloading the sacks or buckets. About one ton and a half can be sent down at one time. The stations are about two hundred feet apart, and the entire apparatus is strong and safe. As the wire rope is elevated about forty feet above the surface of the hill, the Tramway can be worked all winter long, without the slightest trouble.—Utah Mining Journal, Salt Lake, Sept. 23, 1872.

Mining Companies and others desiring to negotiate for the erection of this system of Ropeway, can communicate with me personally, or through Postoffice Box 964.

A. S. HALLIDIE, Patentee,
113 and 115 Pine Street, SAN FRANCISCO.

WIRE ROPE

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and Progressive Industry.

BY DEWEY & CO., Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 16, 1873.

VOLUME XXVII. Number 7.

The Situation and Altitude of Mount Whitney.

At the last meeting of the California Academy of Sciences, Mr. W. A. Goodyear, of the State Geological Survey of California, read a paper to prove that the Mount Whitney described by Clarence King in his "Mountaineering in the Sierra Nevadas" was not the peak discovered by Prof. W. H. Brewer and party in 1864, and then originally named by them Mount Whitney. Mr. Goodyear and Mr. M. W. Belshaw of Cerro Gordo, last month rode their mules to the highest crest south-west of Lone Pine, which for over three years now has been known as Mt. Whitney, and which was ascended and measured by Mr. King in the Summer of 1871. There is no doubt of its identity with the one Mr. King measured, as the half-dollar Mr. King left on the summit in 1871 has been found.

The peak referred to is by no means the highest among the grand cluster of peaks which form this culminating portion of the Sierra Nevadas; nor is it the real Mt. Whitney. Mr. Goodyear produces a good deal of evidence to prove his ground. He says it can be seen by the eye alone that a peak which bears N.67° W. distant between five and six miles from the observer, is considerably higher; other methods were also adopted for measurement. When Mr. King ascended the mountain in 1864, the highest point he reached was 14,740 feet above the sea level, and at the point where his observation was taken, he was, as near as he was able to estimate, between 300 and 400 feet lower than the culminating point of the mountain, which, must, therefore, somewhat exceed 15,000 feet in hight. Mr. Goodyear says:

Now, although I do not recollect the exact figures which Mr. King's observations in 1871 gave for the hight of the peak which he then measured as Mount Whitney, and to whose summit Mr. Belshaw and I rode the other day in the saddle, I do recollect, with certainty, the fact that these figures were a little less than the altitude of the point which he actually reached in 1864, when he was still, according to his own estimate, "between 300 and 400 feet lower than the culminating point of Mount Whitney."

Here, then, there was a discrepancy of at least 300 or 400 feet, and probably somewhat more, between Mr. King's barometric results in 1864, and his results in 1871. A discrepancy hitherto utterly unaccounted for, and, if the two peaks were identical, unaccountable, except by supposing the existence of errors of a magnitude, which is to say the least, extremely improbable, in the whole method of computing high altitudes from barometric observations. This strange discrepancy vanishes at once when the fact is recognized that in 1864, Mr. King was attempting a different, and a higher peak than the one which he climbed in 1871.

The Geological Survey Report (Geology, Vol. 1, pp. 390 and 391), for which Mr. King's notes furnished the material, affords additional proof that the peak, which for three or four years has borne that name, is not the one originally named Mt. Whitney.

"Mount Whitney is a ridge having somewhat the outline of a helmet, the perpendicular face being turned toward the east. There is snow on its summit, which indicates that there must be a flat surface there. The mountain is the culminating point of an immense pile of granite, which is cut almost to the centre by numerous, steep and almost vertical cañons, ending in high-walled amphitheatres. Southward of the main peak, there is a range of sharp needles, four of which are over 14,000 feet high. The general aspect of the group is much like that of Mount Tyndall. This mountain has been approached on all sides except from the east, and found to be utterly inaccessible. Mr. King thinks it possible, however, that some route may yet be found by which the summit can be reached."

Mr. Goodyear says this description corresponds in every respect, so far as Mr. Belshaw and he could see and judge, with the grand peak to the northwest of them—the original Mt. Whitney; and it does *not* correspond at all with the one they were on, and which, by mistake, has borne the name so long.

From these facts it is certain that the peak which for over three years has borne the name of Whitney, has done so only by mistake, and that a new name must be found for it; while the name of Whitney must now go back to the peak to which it was originally given in 1864, and which is, in reality, the highest and grandest of this culminating cluster of the Sierra Nevada.

Furthermore, it appears that Mount Whitney not only retains its claim to being the highest point of land in the United States of America, but that its claim to over 15,000 feet of absolute altitude above the sea is still indisputable; while, up to the present time, it also retains the prestige of the fact that, in all probability, no human foot has ever trodden its summit.

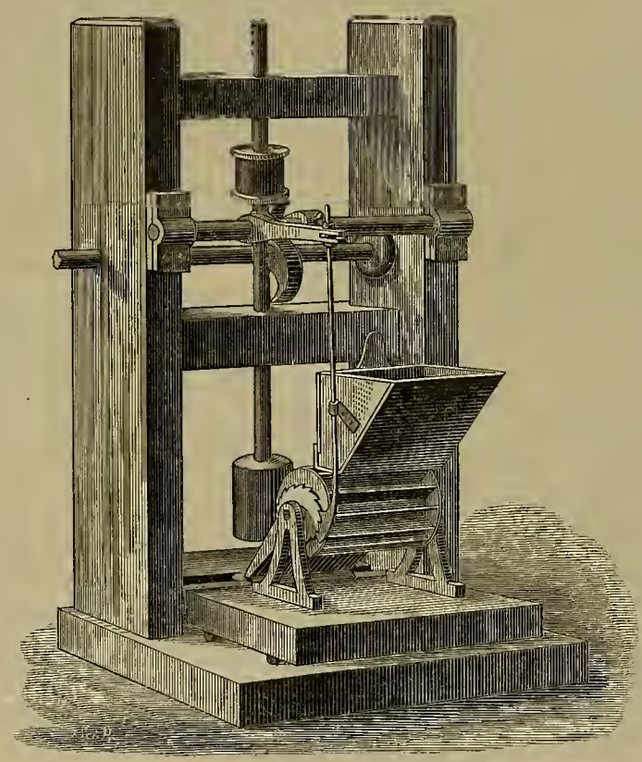
If Mr. King's descriptions, in 1864, of the appearance and surroundings of this mountain on the north and northwest can be relied upon, it is safe to say that no man will ever ride a horse or mule to the summit of *that* peak, unless it be by a costly as well as a dangerous trail. Whether the peak is utterly inaccessible or not is still a question. Mr. Goodyear thinks that it can be climbed; but it will certainly involve a great deal of hard and, very possibly, some dangerous work for anybody who shall attempt to reach its gigantic crest.

The Pioche *Record* has been informed that 145 men have been put at work on the Raymond & Ely mine, which, with 25 more men on the Silver Peak, will put in circulation about $20,000 per month. Business is said to be recovering in Pioche.

The mines on Wagner Creek, Oregon, are being extensively developed and an eight-stamp mill is now being put up, to be run by water power.

A New Ore-Feeder for Quartz Mills.

Our illustration shows a new form of automatic ore-feeder patented through the Scientific Press Patent Agency by James D. Cusenbary and James A. Mars, both of this city. The improvements in the invention consist first, in mounting a feed cylinder on a movable frame or truck, so that it can readily be shifted from place to place, when it is desired to repair the mill; and lastly of an improved arrangement for operating the pawl rod by the drop of the stamp without the use of springs. The figure shown gives a general view of the device in position for working. The feeding-cylinder is mounted on foundation timbers. These timbers are mounted on rollers, so that the cylinder and frame can be moved about as desired. The cylinder shown is made of cast metal and has its outer surfaces formed into chambers or depressions, which are separated from each other by longitudinal partitions. The cylinder and its carriage, when in working position, are placed below the hopper, so that the ore from the hopper will fall into the chambers, and as the cylinder revolves, be carried around until it falls, by its own weight from the chambers upon an inclined apron which directs it below the stamp.



CUSENBARY & MARS' AUTOMATIC ORE FEEDER.

This feeding cylinder being made of cast metal, will not wear out like the endless belts used on some of thie class of machines, and as it turns upon journals like any common roller or cylinder, it cannot become clogged, as the endless belt is apt to do, especially when the ore is wet. To one end of the cylinder is secured a ratchet wheel as shown, and this ratchet wheel is operated by a pawl bar to revolve the cylinder. In order to operate the pawl bar from the tappet, a horizontal shaft is mounted on the upright frame timbers, so that the shaft will pass across directly in front of the tappet transversely to the movement of the stamps stem.

A fixed arm extends backward from the shaft so that its extremity will terminate below the tappet, in a position to receive a blow from it when the stamp falls. Another fixed arm extends forward from this shaft directly over the ratchet wheel, which it operates by a pawl bar, as shown in the cut. It is evident, therefore, that at each drop of the stamp the tappet will strike the arm behind and carry it downward, thus giving the shaft a rocking motion, the weight of the forward arm and the pawl serving to rotate the shaft in the opposite direction, thus feeding the ore in the batteries automatically when it is needed. When there is a sufficient quantity of the ore beneath the stamp the drop will not be sufficient to operate the cylinder; but when the quantity of ore under the stamp is reduced, the drop is naturally greater and consequently the tappet strikes the arm as before described and operates the cylinder.

Utah Mining Items.—Judge Emerson has dissolved McKean's injunction against the Grizzly Mining Company. This injunction allowed that company to extract ore, but forbade its being sold. The Lavinia Company claimed the mine and procured the injunction. The Grizzly is said to be worth a quarter of a million dollars.

Important coal discoveries are reported in Iron County, Utah.

Business men in Salt Lake are very much exercised over the advanced freight tariff on the Pacific Railroads.

It is stated that accurate calculations develop the fact that base bullion from Utah mines cannot be profitably shipped under the new railroad tariff, and that unless a modification of rates can be secured with regard to this particular class of freight, the effect will be to cripple, if not ruin, this branch of mining industry. An effort will be made to secure the assent of the companies to a modification of freight rates.

The extraordinary dull times in Utah are exciting the general discussion of the press. Mine owners find an explanation of this in the infamous swindles perpetrated in Cincinnati, New Orleans, and elsewhere East, and also in Europe, with bogus mines and mines almost valueless. Late accounts from the principal mining districts, however, are more than usually encouraging.

The salt mines discovered in Teche county Louisiana, during the late civil war are now being worked, while the surface is covered with sugar cane. The bed, estimated to contain ninety million tons of pure solid rock salt, located on an island of 300,000 acres, rising 195 feet above a salt marsh. Access is obtained to this Island by a steamboat line running between Brashear city and New Iberia. The soil is composed of sand, loam, gravel and clay, and the surface is partially covered with magnolia, live oak, cypress, maple, locust, gum, walnut and fruit bearing trees. The vegetation resembles that of a rich prairie, and the scenery is varied and beautiful. Access to the interior of the salt mines is obtained by an elevator, running up and down a forty foot shaft, cut through the solid material. The width of the vein is 120 feet, and the visitor is surrounded on all sides by rock salt, as dry as powder. The absence of moisture is one of the most striking peculiarities, and the iron and steel implements used are quite bright. Two large chambers have been cut out of the vein.

The Carson river is so low that none of the mills but those supplied with steam, in addition to their water power, are able to run to full capacity. Several are only working half their stamps.

The monthly production of bullion of the Richmond company's property at Eureka is said to be nearly $100,000 per month.

CORRESPONDENCE.

Notes of Travel in White Pine County, Nevada.

[By our Traveling Correspondent]

Cherry Creek District.

Tbis district was discovered in September, 1872, by Messrs. Carpenter, Corning, Safford, Neil and Hunter. It is located on the west side of Steptoe Valley, in the Egan range, and about 90 milee south of Wells' Station, on the Central Pacific Railroad, aud 750 miles from your city. The fare from San Francisco to this point is about $60; time, 3½ days. The olevation of Steptoe Valley, through which passes the 117th meridian, is about 6,000 feet, and that of

The Mining Belt

Is from 7,500 to 8,400 feet above the sea level. The general course of the mineral, or ore belt, is from north to south, but, as I will describe further on, one or two of the ledges of this range run northeast and southwest, and dip from north to northwest, at angles varying from 45 to 70 degrees. The ledge matter is continuous, but the ore body occurs in chimneye. Commencing on the east side of the Egan range (that portion known as Cherry Creek District), the formation is as follows: First, a belt of granite, varying from 150 to 200 feet in width; next, abslt of qnartzite, about one-quarter of a mile wide; next, a belt of slate, 300 feet wide, and some of it fine enough for roofing purposes; then another belt of quartzite, about one-quarter of a mile wide; then a belt of limeetone, about one-half of a mile in width; next, a shale formation, 300 fcet thick, which forms the upper or hanging wall of the Tea-cup ore belt; from this the limestone extends for many miles to the westward, occasionally broken by mineral-bearing quartz.

Cherry Creek

Ie located at the mouth of the cañon, through which flowe Cherry Creek, and within from two to six milee of the mines. Mr. D. R. Collins is the Mining Recorder of this district, and is a resident here. The town contains about 80 or 100 inhabitants, and the district about 150. The indefatigable Molinelli is here with his Pioneer hotel. His fame as a caterer is well known throughout Nevada. Thé first building in this place was completed ou the 15th of last May. There is one general store, one variety store, two blacksmiths, one restaurant, two livery stables, and some half-dozen ealoons. Beginning at the south end of the district, the mines are as follows: The

Pine Nut Mine,

Located on the northeast side of the Egan range, about four and a half miles west of the town of Cherry Creek, near the summit of the range and just below and west of the limestone belt. This mine is owned by Messrs. P. and M. Logan, and D. B. and L. D. Pierce. The location runs northeast and southwest, and dips to the northwest. It is 1,500 feet in length and 600 in width, with several acres of croppiuge. The development thus far consists in an open cut run in about fifteeu feet on the ledge, revealing some very fine ore, containing Stetefeldite, chloride of silver and a trace of copper. Thirty assays of this rock gave from $158 to $5,500 per ton, and it is claimed that the ore now on their dumps will run over $1,000. They have about two and a half tons of thie character, and about ten, taken from the croppings, that will pay $500 per ton. Next adjoining on the northeast is the

Keystone Mine,

A emall location, 400 feet in length, belonging to Messrs. Huntcr, Safford & Co., six equal partnere. But little work has yet been done on this mine, but sufficient to class it among the most promising of the district. Passiug on still to the northeast, we come to the

Midas Tunnel Co.

This Company owns 1,200 feet of the main lode, running through the mountain. There are three partners, Messrs. John Coughlin, W. H. Duren and E. F. Hanley. Mr. Cougblin is Superiutendent. These gentlemen are developing their mine by a tunnel run in on the ledge for a distance of 75 feet, at which point they have struck very good milliug ore—gray carbonate and black metal. The country rock here is limestone, the ledge pitching to the northwest. Soveral feet of ledge are visible, but the exact width is not known. They have about ten tons on their dumps that will average $63 per ton. Are workiug two men.

The Step-toe Mine,

Owned by Pierce & Logan, coutains 800 feet of location. The character of the ore is the same as in tbe abovo mentioned mines. But little development has been made on this claim. Next adjoiuing and last on this lime belt is the

Mountain View,

An original location of 750 feet, owned by Hunter & Co. An opeu cut has boen run some 60 or 70 feet, from which some very rich rock has been extracted—assaying up in the thousands. The general character of this mine is much the same as in the others, from the Pine Nut mine. About twenty-five tons of first-class ore are to be seen on this Company's dumps. At or near this point is another ledge, lying to the eastward and running at an acute angle from the last mentioned, having a nearly north and eouth courso, and known as the

Lower Belt.

This ore body has a limestone foot-wall and slate hanging wall, the ledge dipping to the west at an angle of about 40°. Commencing at the south end of this belt, the locations are as followe: First is the

Golconda Mine,

A claim of 1,500 feet on the length of the lode, and owned by Safford & Co., six eqnal partners. Though the croppiugs are very rich, but little development has been made. Next on the north is the

Empire Mine,

Owned by the same parties. The location is 1,500 feet. A shaft has been suuk 10 feet on the ore body, the croppings of which are about twenty feet wide, showing mineral in the entire width, contaiuing chloride of silver, Stetefeldite and copper stains, prospecting quite richly in silver. Next on the north is the

Shonte Mine,

A small location consisting of 250 feet in length developed by a small cut, revealiug some fine ore, and owned by Hugh Gilligan. Next adjoining the Shonte on the north is the

Delta Mine,

In this location there are 1,500 feet; it is owned by Messrs. Collins & Franks. Near the center of this location the ledge leavee a north and south course, and from this point to the north east, with a hanging wall of limestone, and a foot wall of qnartzite, a shaft 10 feet deep has been sunk upon this location, showing ledge matter some 15 feet wide, with some ore of a little different character from the above mentioned, carrying some lead. Next adjoining on the northeast is the

Geneva Mine,

Containing 1,500 feet, iu the location. Hunter, Safford & Co. own this claim. The croppings here are visible the entire length of the location with a width of from 15 to 20 feet, and in places standing 40 feet high. Tbe hanging wall is limestone; the foot wall, quartz. It has not been developed at any point over ten fect, but by the time the company have mined and milled all the croppings, some of them will be old men. The character of the rock is somewhat different from that of any other mine in this district, from the fact that it carries a cousiderable amount of free gold, and some silvsr. Assays from the Geneva run from $60 to $1,500 per ton. Thousands of tons are iu sight and are apparently easy of extraction.

Still to the north is the Little Giant, a location but slightly developed, though the croppings are very promising. Beyond it is the

Exchequer Mine.

This mine is at present bonded to A. H. Hagadorn, of Nevada City, and some San Francisco capitalists, for the sum of $40,000. It is the property of Messrs, Moore, Edgar, Parker and Hyde, and has a length of 1,500 feet. A shaft has been snnk 18 feet, and a small open cut rnn upon it. An ore body 20 feet thick is shown that assaye from $40 to $5,000 per ton. They have 15 tons of ore ou their dumps that, it is estimated, will mill over $300 per ton. Three tons of fine ore have been sent to San Francisco for assay.

Victoria Mine.

This is an original location of 1,500 feet in extent, on the same belt as the Geneva but dietant about two miles further north. It is situated five miles north of Cherry Creek, and at au elevation above Steptoe valley of 800 feet, or about 7000 feet above tide water. This mine is owned by tbree eqnal partners, consisting of Messrs. J. S. Low, Wm. Connelly aud Thomae Phillipe. This mine differs a little from any other on the same belt above mentioned, as both hanging and foot wall are porphyry; it dips, however, in the same direction, and at the same angle. The development consists of two shafts sunk, one 49, and the other 20 feet deep; and a tunnel run in aloug the hanging wall of the ledge a distance of 96 feet.

The ledge matter in this mine runs from 30 to 60 feet wide, and shows some ore throughout. From assays made on ore taken both from the shafts and tunuel, it ranged from $240 to $2,500 per ton. It will rank favorably, to say the least, with the most prominent mines of this district. I think its proprietors have a fortune it, if they will take it out. At this writing they have about 40 tons on the dumps, that will run several hnndred dollars to the ton. About 3,000 feet furtber north and npon the same belt, after passiug the Connelly and Badger mines, is the

Red Rover,

owned by Wm. Connelly. It also has 1,500 feet of location. Little development has been made upon this mine, but the few feet tbat have been sunk upon the ledge show a fine body of ore. Iu character it is similar to that of the Victoria, there are about four tons of very fiuo ore on tho dump of this mine, assays from which show it to coutaiu about $15 in gold and $247 in silver per ton. L. P. Mc.

[Concluded in our next.]

Vienna Exposition.

The 4th of July wae celebrated in Vienna by a great many Amricane. There was a dinner at five o'clock, to which the foreign Exposition commisoionere and some others were invited. Drinking, eating and speeches constituted the principal part of the celebration, as nsual.

The *Neue Freie Presse* had a leading article with reference to the 4th of July. It is one of the largest and most influential Vienna papers; it saye: "Three generations passed away since the bold movement, by which England was deprived of the largest part of her American colonies for ever, and by which their loyal people became aliens and most dangerous rivals. Since then the star-spangled banner has waved before the sons of the great republic in many a battle, in many a bold hazard, competed at sea honorably with the Britieh, was carried victorious into Mexico, and came out pure and unstained from the greatest and bloodiest civil war ever known to modern history. And if the Americans with their young history cannot contend with old nations and statee in the glory of war, they stand equal in arts of peace; their industry progresses rapidly and steadily; their enterprises are bold, overcoming all difficulties and impediments. It is worth while to remember the festival of the Uuited States, for this tall and stout Benjamin of the international family has already given many a useful lesson to his mother Europe, for which we may feel thankful."

The article is too long, to be translated in full. It points further back to the time of our civil war, and the ridiculous prophecies of certain official quarters after the fall of Sumter, to the prevailing idea in Europe that, to be a statesman one must be, if not of noble descent, at least cognizant of all bureaucratic secrets and ways, but that the Americans demonstrated the contrary, that politicans are born, (not as cavaliers though,) and that it is not necessary to get old in office before one aquires the skill of defendiug the intereets of his country. "How pitifully," says the article, "has English diplomacy been outwitted and fooled during the Alabama negotiations, especially by the Washington treaty. This combat at the green-table proved clearly that to be an able statesman, it is not sufficient to possess a noble name and an office-rontine."

Although the month of June was not much better in regard to weather than the unfortunate cold and wet May, the prospect of the World's Exposition improved above expectation.

The Average Attendance

Of May, ae I wrote you, was 10,200 persons per day, if I am not mistaken. The average of June shows 40,537 visitors per day, notwithstanding all the lies about cholera and other contagious diseases, fabricated by enemies to thate nterprise. The account of June shows that 25-ccnt tickets (of 14 days) yielded 252,002 guldens, while the 50-cent tickets for 16 days realized only 179,150 guldens. The present arrangement allows one to visit the exposition five days of the week for 25 cents, and two days for 50 cente. Ten tickets can be bought for $2.

Ascending the Rotunda costs 20 cents, and it is really worth while to enjoy the splendid panorama from above. It is very intcresting also to see the monstrous strnctnre of the dome while walking over it on safe galleries and stairs. There are several telescopes for public use, on the outside gallery. On a clear day one can see the beautiful surroundiugs of the old friendly imperial city, which has been so much embellished during the last ten years, that it looks like an old object in a new dress. Descending from the first gallery, inside, throngh the pillar, it is somewhat dark, but I used the Mexican invention of keeping one eye shnt while ontside and opened the reserve on reaching the small stairs.

On the 29th of June, Vienna oxperienced

A Severe Storm.

The rain came down as if a dam had suddenly been broken open somewhere in tho dark clouds. The lightniug etruck, split aud broke down a tree close to the American restaurant, injuring nothing but the roof. In some of tho covered yards of the palace a few glasses were broken in, but not much damage was done; the whole bnilding stood well, especially the machinery hall. The great balloon Captif, which was fastened by 14 anchors, ready for use, was torn away and escaped npwards taking a northeasterly course, but after some hours descended again near Altenburg in Huugary and was cut there iuto several pieces by some brutes. This balloon was made nnder the direction of M. Yon, of Paris, on Giffard's system; was 25 metres (81 feet) in diameter and contained over 400,000 cubic feet of gas. By means of a wire ropo the Captif was prepared to make several trips about 1640 feet high and be brought back again. There was room in it for 12 persons, and each had to pay $5 for a single ascent.

According to the reports from all parts of Europe, active preparations are made by

Professors and Teachers to Visit the Exposition

During August and Septembor. The principal aim of this visit is, as a mattor of course, the study of the school and educational departments on exhibition. It is to be hoped that American teachere and professore will also take part in this very important study. If one considers the means of education of the preeent time, the perfect models and figures, prepared parts of the human body, and thousands of other ingenious arrangemente, by which the theoretical teaching ie made intelligible and impresssive to the young mind, there is no wonder if one feels a desire to be born over, just only to make nse of those blesings, which we needed fifty years ago. And these vehicles are not limited certain classes, but extend through the whole educational system, the most, however, in the technical schools.

The Austrian Rural School-House

Was opened only a few days since. Entering the lower department, in the first room or autochamber, besides different pictures of natural history, there are several little boxes about ten inches square and four deep, filled with different sorts of soil, light, dark, sandy, etc.; in each of these earths is a thermometer fixed so that the quicksilver dips a little into the ground, to demonstrate that different sorts of soil are differently warmed at the same temperature. In a frame is a number of twigs put together so as to show the different ways of grafting, etc. The next room presents variouo means of elementary education, commencing with a, b, c tables; then there are a number of emall collections very properly arranged—not a single specimen more than necessary to answer a question connected therewith, for instance: how the cotton is spun; how beet-sugar is made; how glass plates are made; how iron is extracted and transformed, and so forth. Seeing the stuff in different phases, from the raw material to tbe finished article, it impresses such a vivid idea on the young scholar that he is not likely to forget the procedure. This method deserves imitation. There are collections of minerals of most frequent occurrence: beetles and butterflies, flowers and plants on tables, weights and measures, from the smallest to the largest in size. There are a few anatomical preparations showing the construction of the human body, and so forth. Up stairs are desks for forty-four scholars—two double desks together, so that four scholars sit in a row. The other outfit as nsual—blackboard, maps and so on.

The Swedish School House

Is a little smaller than the American. In 1871 there were in Sweden 4,204,177 inhabitants, with 3,685 school-houses, 3,833 low schoole, (Kleinechulen) and 10 high schools. Among the schools which are found in cities and well populated villages, are also 1,145 schools for less populated districts, where two or three parishes unite for one school. The attendance is obligatory, and the direction and manage-ment of all schools is in the hands of the priests. The school room at the Vienna exposition contains 40 desks, each for one pupil, arranged one behind the other. The desk is of plain wood; the plate movable or eliding, and covers in this way inkstand and pens. Lifting half of the plates, you find a shelf for books, etc., a very necessary arrangement; but nothing of the kind in the American schoolhouse, which, compared with the California school-houses, is not the best representation. The seats of the Swedish desk are lese comfortable than the American. The walls are covered with maps, the most representing Norway and Sweden, with tables of botany, natural history, anatomy, etc. There is a pile of pictures of natural history, the plates 10 inches by 12, each showing one animal. Other pictures of the same size, illustrate events of biblical history. On the teacher's desk stands an unglazed earthen pitcher, so that it is kept constantly wet by the penetrating water, which keeps the inside cool by evaporation like the Mexican oyos. This pitcher was pointed out to me by the gentleman in charge of the school-room. He called my attention also to two blackboards, on the upper part of which are 8 maps, four on each, on rollers, so that each can be drawn out and rolled back, like those in the hall of the mercantile library of San Francisco. There was a reckoning apparatus with sliding balls on the wires, as introduced in all schools, but there was an improvement on it, by which children of dull nature are more easily induced to comprehend addition and substraction, so says the teacher. There are for this purpose eight upright wires, the lower ends fixed to the frame, the upper free, so that the balls may be taken off. The first wire has one, the next two, and the last eight balls, and the use is as follows: I let the boy count the balle, eay on the last wire. "How many are there?" "Eight." I lot him take off a few. "How many have you in you in your hand now?" "Three." "How many wore on the wire before yon took three?" "Eight." "Count how many are left after you took three away?" "Five." A very good thing is the air purifier, a small tin box about 9 inches long, 6 inches high and 2 inches wide. The cover has 20 tin plates, 2 inches wide and 6 long, soldered to the cover inside and divided on the length of 9 inches. The box contains coal tar. At night the box is closed; in the morning the cover is drawn up and the 20 tin plates come in sight tarred. The evaporating tar, it is said, destroys unhealthy gases. The above size is large enough for a school-room of ordinary size. A geographical blackboard, about 5 feet by 3, represents Sweden and Norway, showing boundaries of districte, rivers, towns, etc., but there are only holes in place of towns, without names. By the blackboard, outside of the map, are wooden pins with the names of towns, rivers, boundaries, etc., and the scholar has to place each pin in its proper

place. This method seems to be very practical. Collections of minerals, plants, flowers, seeds, maps and many other things, render this school very interesting.

The Portugese School

Is quite in the same neighborhood of the American. The arrangement does not differ much from ths others. The first room is a girls' school. Nice handiwork of all kiuds is exhibited here and proves that the Portugese ladies have just as much skill and taste as those of other civilized countries. The other room is for a boys' class. The desks are similar to the Swedish, but one for two boys, as in the Austriau school. There are very neat handwritings in Portugese, French and English, from scholars whose names and photographic portraits are attached to the respective writing. It was a good idea to exhibit photographic views of the interior of different schoolrooms, boarding, sleeping and studying rooms of scholars.

The Austriaa Exposilion of Means of Educalion

Occupies a large area of nearly 12,900 square feet. It is a collective exposition and for this reason very difficult, or rather impossible, to arrange the objects of the same class all together as they should he, for the convenient study of the visitors; but nevertheless there is as much symmetry in the arrangement as possibly could be, and it is easy to gain a good review of the whole. The space ie divided iuto three parts marked by large hanging signs indicating primary, middle and high schools. There are large tables in the middle of the space, covered with excellently executed objects of physical science. Very instructive are the collections of different industrial branches, representing the different phasee of certain raw materials, with respective tools, instruments and machines, of course, on a small scale, means for arithmetical instruction, physical instruments for primary and middle schools, various models, collections of seeds, fruit, minerals, animals of the whole animal kingdom, splendidly preserved and preparod organs of the human body, relievo maps of volcanos, etc. It ie impossible to go into a detailed description. It would require a book for this purpose alone, as is the case with the North German exhibition of means of education.

The Austrian school statistics for 1871 show 14,769 primary schools, with 25,259 teachers and 1,820,710 scholars of both sexes.

The Kimball Buggy,

Manufactured by your enterprising Kimball Carriage Manufacturing Company, of San Francisco, appears after all in the Exposition. It was the only one in the American Department. It is admired very much, but many go off shaking their heads, as if they would say they wouldn't trust themselves in such an appareutly frail affair. It is rather light for the people in this country, but the durability and strength have been well tested in California as well as the Eastern States.

The balloon Captif traveled back again to Paris to he repaired iu Yon's atelier. It will require 25,000 francs and six weeks time to repair it.

A correspondent of *Engineering* says that everyhody must admit that in this line England has accomplished the most; that no other nation can compare in the least its machinee with the English. It is known, he thinks, that prominent English firms did their utmost to introduce their

Agricullural Machiaes

On the continent and that they acquired such practical experience with reference to the wants of the different countries that it is an easy matter for them to stand competition. But the joke comes with the conclusion that it seems to him as if the Continental machine factories by their meager and imperfect participation in the Exposition did not wish to compete with England, or what may he probably more correct, they feel too incompetent as yet to do so. This correspondent has seen the spendid steam plows in the English Agricultural Hall and they are found nowhere else, but if he says that the Continental representation, in agricultural and other machinee, was very slight and imperfect, it is questionable whether he visited the Eastern Agricultural Hall, and one might suppose also that when he passed the Machiuery Hall, through the Austrian, German, Swias and Belgiau departments, crowded with locomotives, railroad cars, webbing, embroidering, sewing and all kiuds of working machiues, he probably thought he was in England, and when he entered the English Department he thought he waa in Germany. Of the American competition on the Europeau continent he takes no notice. An article iu the Auestellungs Zeitung of the *Neue Frei Presse*, about

Sewing Machines,

Says: "Tho great euperiority which the inhahitants of the New World have acquired in all practical fields above the Europeans, appears nowhere more impoeing and striking than in the field of machinery. And indeed the performances of the United States in this line are astonishing. Whatever labor the restless, active, human mind could deviee to dispense with, or at least to limit the tiresome handwork to the emallest possible degree, is surprisingly accomplished by the American machines. The same skill ie evident in the most powerful and complicated machines as in the smallest eewing machine. The United States atands, in fact, on the highst point of indnstrial progress." G. K.

July 11, 1873.

MECHANICAL PROGRESS.

Surface-Hardening of Steel—Curious if True.

The following paragraph is at present going the rounds of the scieutific and mechanical papers. We clip it from *Van Nostrand's Engineering Magazine*, but have grave doubts as to the accuracy of many of the statements:

"The action of rubbing surfaces moving at a high velocity is proposed to be applied to the surface hardening of steel, by Mr. G. Armes, Rochester.

"This invention has been patented, and consiste in hardening the surface of steel without hardening the body thereof, by subjecting the surface of the steel to be so hardened, while in motion, to the action of a surface in contact moving at a high velocity.

"If, for example, it be desired to harden the surface of a cylinder made of steel, the cylinder is mounted in a lathe turning at the slow motion usually given for turniug such a body in the nsual engine lathe. To this is applied an emery-wheel rotating at a velocity of ahout eighteen hnndred revolutions per minnte. The periphery of the emery-whcel is kept in contact with the surface of the cylinder, which, in addition to its slow rotary motion, has a traversing motion of a little less than an inch to each revolution. At the end of this operation the entire surface of the cylinder will he hardened to a depth of about 1-32 ineh, and so hard that it will resist the action of the best tools made of cast-steel and hardened in the usual way.

"Better results, it is stated, can be obtained when the emery-wheel can he run at a higher velocity than that above given; and cast-iron wheels with smooth faces, or hard substances, may ho employed in lieu of emery-wheels.

"For hardening flat surfaces, the piece of steel should be mounted in a carriage so that it can be moved forward, in order to present in succeesiou every part of the surface to contact with the periphery of the wheel; or the same resnlt can he produced by mounting the wheel in a carriage having the required traversing motions. Or if the surface to be hardened be of greater width than the face of the wheel, the block steel may he mounted ou a carriage having one motion, and the wheel also mounted in a carriage having a motion at right angles to the motion of the block-carriago.

"If the surface to be hardened be of any form than a cylinder or flat surface, the form of the periphery of the wheel or the motione to be given, other than the rotary hardening motion, mnst be such as to present in succession every part of the surface to the action of the wheel.

"The process can obviously be applied to the hardening of the surface of any article made wholly or in part of steel, unless the surface be so irregular that the required motion for contact and action cannot be attained or effected."

The Augsberg Web Press.

We glean from *Engineering* the following interesting facts concerniug the Augsberg priuting press, a modification of the Walter press, now on exhibition at Vienna: Thie machine is intended to deliver up to a speed of 12,000 sheets printed on both sides per hour. Its action is very eimple. The roll of web paper is placed at the end of the machine as in the Walter press, but the paper ie here taken from the underside of the roller instead of the top. The paper first passes through damping rollers, which can be arranged to give it any reqnired degree of wetness; and then it makee its way—through rollers which are adjustable to regulate its tension—to the first type cylinder. The paper is printed from stereotypee cast in semicircular moulds so as to fit round the type cylinders. This method is adopted in all web printing machinee, and by nsing it the fonte of type may last twenty years inetead of two, while the printing is quite as clear and good as if it were done from the type direct. From the first pair of cylinders the paper is carried npward over the upper impression cylinder, and in passing between the latter and the upper type cylinder, it is printed on the eecond side. As the four cylinders are all exactly of the same diameter, and are placed close together, the printing ou the second side must coincide exactly in its position ou the sheet of paper with that on the first. The printing operation being now completed, the paper paeses to the cutting cylinders. These are at the same level as the npper type and impression cylinders, and are necessarily of the aame diameter, that diameter being snch that their circumference is exactly equal to the length of the sheet which is to form one copy of the newspaper. On one of the rollers is an ingeniously arranged cutter, and on the other, at a corresponding poiut, a kind of groove or seat for the projecting knife. The apparatus for distrihuting tho ink is very complete. There are many interesting details about the machine, but they are unfortunately of a natnre which cannot well be made intelligible without the aid of drawinge. The differencea in constrnction, between this, the ordinary Walter, the Victory, the Marinoni and our Hoe Cylinder, are of arrangement of parts rather than of principlo.

The Walter Press (of which tho Augsbnrg is a type) derives its name from the proprietor of of the London *Times*, to whose enterprise it was owing that the costly experiments were made, which resnlted in the production of the first successful web press. We helieve the credit of its actual invention is, however, due to Mr. Macdonald and Mr. Calverley, the manager and engineer respectively of the *Times* printing office. During the years 1863—'66 tho first machine was slowly elaborated, its construction being kept secret. For a year and a-half more it took part in the printing of the *Times*, bnt still in secret. In 1869 the results were deemed so satisfactory that the machine was put on the market, and with great success, as very many of the large European journals are now printed by it.

A New Motor.—Louis Charles Errani and Richard Auders, of Liége, Belgium, have patented in this country a new motor, operating as follows: Oil is sprayed into the cylinder behiud the piston, and, being mixed with air, is ignited at the proper point hy au electric device; the consequent expansion drives the piston forward, the momeutum of the fly wheel returning it to its first position. An ejector supplies the oil from the tank to the sprayer, the ejector heing connected to a piston blower driven by a crank attached to the main shaft. The general principle is the same as tho gas engine.

SCIENTIFIC PROGRESS.

Death by Lightning.

Rev. H. C. Hovey communicates the following to the *American Journal of Science* for August:

A thunder-storm passed over Kansas City, Mo., on the afternoon of Sunday, June 15th, 1873, the resnlts of which, so far as a single stroke of lightning is concerned, the writer has taken pains to verify by personal examination and the testimony of eye-witnesses.

When tho storm arose, a number of persons were walking on the broad platform of the amphitheater, in the fair-grounds adjacent to the city. The promenaders, either iu iguorance, or negligeuce, of the laws governing the paseage of electrical currents, sought refuge from the rain nnderneath the leafy branches of some oak trees which shade the locality. Under the tallest of these oaks, fifteen feet from the point where its trunk passes through the platform, and within three or four feet from the overhanging boughs, stood Miss Nora Ritenour and a young gentlemau who had accompauied her to the grounds. An electrical discharge sought them out, on its way from the clonds to the earth. She was killed, and he was crippled; while the shock was felt for a hundred yards from the fatal point of impact, jarring buildings, and benumbing and prostrating humau heings, so as to prevent spectators for a few moments from coming to the aid of the chief sufferers. When they did so, they found to their horror, that the body of the young lady was actually undergoing combustion, making it necessary to extinguish the flames by pailefnl of water. On inspecting the remains it wae found that the first point of contact was the chin, where a red mark was left as if hy a violent hlow. The rest of the head showed uo exterual injury except that the hair was burnt to a crisp. From the chin the electrical fluid sought the body, breaking the neck, and burning the hreast and abdomen through and through. Its exit was by tho right foot, leaving only a well marked groove along the limb; but tearing the shoe into shreds. Death must have been instantaneoue, and was probably void of seusihle pain, if oue might judge from the placid features, and the natural and agreable expression of the eyes.

It seems as if the stroke mnst first have traversed the adjacent oak, but the most careful examination discovered no disturbance of its branches, or injury done to its sturdy trunk. On leaving the body of Miss Ritenour, the entire discharge passed through tho plank on which she stood, piercing it like a musket ball, the upper side of the perforation being smoothly depressed, while underneath it was jagged and enlarged. From the plank the bolt leaped two feet to a beam, along which its path was divided; being marked by a fissure leadiug in opposite directione to the two posts hy which the beam was supported. These posts were of white pine, thoronghly seasoned, and about one foot in diameter. One was merely split from top to bottom, while the other waa tterly apliutered. To this latter piece of timher, boards had been nailed; and to each nailed head, in passiug, the electrical fluid paid most discriminating attention, splitting the boards ae if with the edge of an axe. The ground at the foot of these posts was not visibly disturbed. No traces of fire were to he seen ou the dry, inflammable pine wood, although the living object, on which this memorable thuuder-bolt concentrated its fury, was so fearfully burned.

Am. Association for the Advanoement of Science.—The 22d meeting of thia Aesociation will be held at Portland, Maine, and will commence on Wednesday the 20th of October. Prof. Lovering of Cambridge is President for the year.

Platinum is being used quite extensively in various alloys to prevent oxidation. A very small percentage of this metal, it is said, protects Germau silver, aluminum bronze, etc., completely.

Celestial Origin of Positive Electricity.

M. Becquerel has recently preseuted a memoir to the Academy of Sciences of Parie upon the celestial origin of atmospherie electricity, or rather of the positive electricity distributed in enormous quantities in the planetary spaces. This he finds in the hydrogen electrized positively which escapes continually from the snn. According to modern observations the solar spots are in reality cavities, by which the hydregen and the various substances composing the solar atmosphere, escape from the photosphere, this hydrogen being the resnlt of a decomposition, bringing with it positive electricity, which ie distribnted in the planetary spaces, diminishing in intensity more and more toward the earth, in consequence of the poor conducting power of the more and more dense strata of the air, and of the superficial crust of the earth, this latter being negative only because it is less positive than the air.

For this electricity to be propagated in any medium, some substance is necessary as a vehicle; and it is established, iu fact, that the luminous properties of electricity belong in a great degree, if not entirely, to the ponderable matter across which the electric discharges are transmitted. The auroras resnlt from the discbargee of this electricity, thus explaining, according to M. Becquerel, the rnstling or crackling sound heard by the inhabitants of the polar regione. This occurrence, although apparently well attested, hae heen denied by eome; but the experience of M. Rollier, the intrepid aeronaut who was carried in his halloon last December from Paris to Norway, and landed on a snow-covered mountain 10,000 feet high, confirms thie view. Thie gentlemen remarks, in his report of the voyage, that while passing through a thin fog he perceived the brilliant rays of an aurora tinging every thing with its strange light. Very eoon a curious and incomprehensiblo roaring was heard; bnt this, after a time, ceased entirely, with the development of a decided odor of sulphnr, which was almost suffocating.—*Harper's Magazine.*

Moral Tendency of Arts and Scienoe.—The exclusive claim of metaphysics to the moral gnidance of modern society continues to be asserted with all the more tenacity, as its claim to intellectual guidance is relinquished to physical science, based upon observation and experiment, as the only reliable means of the progress of civilization, which is but another term for the progress of the physical sciences, and their corresponding arts.

The trinmph of physics over metaphysics is complete in the domain of the inorganic sciencee over which metaphysice has surrendered all supremacy, and abandoned the contest, in order to concentrate its forces in defenee of the organic sciences, including man and eociety. But man and society are gradnally deserting the ranks of metaphysics, and rallying aronnd the standard of physics in regard to the organic sciences, morals included. They prefer physical to metaphysical light, hydrogen gas to metaphysical gas, revolt from all authority but the demonstrations of reason, deduced from an induction of facts, established by observation and experiment.

In the science of astronomy, for instance, they find a scientific unity, compared with which the metaphyeical unity is that of Bahel. The confidence and faith of mankind in the prediction of astrouomers, in regard to an eclipse, is a case in point, showing the euperior infinence of physics over metaphysice, upon the intellectual convictious of modern society. Upon this single point the world is catholic, and nniversal, and uniform, and harmonions in ite faith. Cau metaphysics exert any such influence? Here ws see the omnipotent power of demonstration, based upon obeervation and experience, illustrated to the satisfaction of all alike. So in morals. The discovery of a scientific principle, and its application to a new art, exerts a more powerful moral influence than any metaphyeical dogma unverified and unverifiable by observation.—*Am. Artisan.*

Whittbread's Sewage Process. — Purely mechauical means haviug failed to satisfy the conditione in treating sewage, chemical agents have been tried with more or less success. It being manifestly impracticable to handle the aewage in ita crude form, what is desired is to obtain a valuable, compact manure on the one hand, and to purify the resnlting effluent, or remainder. Mr. Whittbread uses a solution of phosphate of lime in a water solution of superphosphate of lime. A small qnautity of lime is added in order to precipitate a dicalcic phosphate, which is stated to afford a chemical fact hitherto nuknown, the combination of such salt with the organic nitrogen in solution in the sewage. The patentee claims that the procesa recovers nearly donble the weight of the chemicals employed, and in a still more valuable form. It is also said that the materiale nsed can be cheaply prodnced.

Professor Silliman has examined the findings of one of the expeditions to Arizona, last year, in search of precious stones. He prononnces the "rnbiea" garnets of very fine color and good size. The "emeralds" are chryeolite, too faint in color to be nsed as gems. The "diamouds" are quartz, some opaline, others hyaline, and all smoothly polished.

Our Weekly Stock Review.

THURSDAY EVE., Aug 14, 1873.

The Stock market for the past week has been so excessionally dull and weak that there is nothing of interest to record. The dividends paid by some of the mines has had no effect to enliven business and it remains so it has for several weeks. In this connection the *Alta* says:

"The depression in the Stock market is, no douht, to a great extent, the reaction from the great excitement of last year, and is not peculiar to this Coast since the same cause has produced similar results at the East, in England and in Western Europe. But most mercantile business and industrial employments present the same features. The market here was stocked with goods somewhat beyond the demands of a limited population for consumption, and it is quite possible that the consumption was below its normal ratio, by reason of the immense stock excitement of last year, which involved all classes at the East. Particular branches of business, Tea importing, in particular, felt the effects of over action in numerous failures, and the depression in other business is manifest in the great diminution of orders for goods on United States account. A similar lull in business affairs has been experienced in most of the European markets, and many have been puzzled to discover a cause for this epidemic depression."

The mines all look as well as ever and a good amount of coin has been distributed this month among lucky shareholders in dividend-paying mines. Belcher paid $7 per share, or $728,000; Crown Point paid $4 per share, or $400,000; Eureka (G. V.) paid $1 or $30,000; Minnesota paid $1.50 or $30,000; Golden Chariot paid $1 or $30,000. There is, however, hardly any business being done in stocks and the fluctuations are of little interest.

MINING SUMMARY.

THE following is mostly condensed from Journals published in the interior, in proximity to the mines mentioned.

California.

INYO COUNTY.

NEW DISCOVERIES.—A correspondent of the Sacramento *Union*, writing from Panamint Mountains, Inyo Co., July 22d, gives this intelligence: "The recently discovered silver mines in these mountains are beginning to attract attention. The first discoveries at locations were made here several months since by H. Jacobs, W. L. Kennedy and R. P. Stewart. The latter thus far found crop out conspicuously, are well defined and show a large fractiou of good ore. The principal vein of the belt discoved by Jacobs and Stewart is the Wonder of the World. It can be easily traced for a distance of 3,000 ft., and in some places it stauds high out of the ground, and is 30 ft. in thickness. It will average at least 6 ft. in thickness for nearly 3,000 ft., as some of the ore has assayed as high as $3,000 a ton. Indications now seem to warrant the conclusion that this will ultimately become one of the best-paying silver districts on this Coast. Among the principal pioneers and owners are R. C. Jacobs, Dr. A. K. Stearns, Robt. Stewart, D. G. Tipton, H. Gibbons, J. Dempsey, Jas. Scobie, Mr. Chunn, J. Copely and many others, whose names I cannot remember. A town site has been surveyed, a Recorder's office established, and nearly all claims recorded. The altitude of the new town is about 6,000 ft.—a little more or less. The distance from here to San Francisco is about 600 miles in a northwesterly direction."

LIDA VALLEY.—Times are very quiet in Lida Valley since Hickey & Walker's mill shut down. This result was caused, not by any failure of the mines or mill but that of the San Francisco firm, Parker, Watson & Co., who own property, including an interest in this mill, is under attachment, hence the stoppage. It is thought an early arrangement can be effected so that the mill and work will soon start up again, a consummation most ardently desired out in that region.—*Inyo Independent.*

TUOLUMNE COUNTY.

THE SHAWMUT.—The Tuolumne *Independent*, August 9: The Shawmut Quartz Mill, started up for the first time last week, but unfortunately the crank to the engine broke, which necessarily stopped operations for the time being.

THE RAWHIDE MINE.—The Rawhide Co. have completed arrangements to commence operations on the mine next week. A larger pump than formerly used has been procured, showing a determination to take the water out of the shaft at any cost.

Nevada.

ELY DISTRICT.

CHIEF OF THE HILL.—Pioche *Record*, Aug, 3: Sinking down from level of the Burke tunnel, 280 ft. Still sinking night and day, and will soon attain the depth of 300 ft., when new levels will be run. Ore in the stope shows no material change. A level from the bottom of the Wright shaft, 210 ft. deep, has been run west 100 ft., showing ore most of the way, and is still being driven ahead with two shifts. Working the same number of men as last week. About 75 tons of ore on the dump, and adding to the pile every day. Expect to have a crushing shortly.

HAVANA.—Since our last report the shaft has been steadily sunk and the pay streak has as steadily widened. It is now 6 ft. wide, and still dipping towards the hanging wall. There is no longer any doubt that a large and permanent body of ore has been struck in this mine. In quality, too, it is constantly improving, and averages very high grade.

CAROLINE.—Sinking the main shaft, which is being solidly timbered. Making about 1 ft. to the shift. The rock is soft and very favorable for working. The erection of steam-hoisting works will be commenced during the ensuing week.

CHIEF EAST EX.—Still taking out ore from the 225-ft. level—the ledge never looked better. It is fully 4 ft. wide, and the rich streak on the foot wall is a high foot in width.

PORTLAND.—Sinking the main shaft by contract. It is now upwards of 1200 ft. deep. No change worthy of ment on elsewhere.

RAYMOND & ELY.—The works are fast approaching completion, and work in the main mine will soon be resum

0 ft. and well timbered. There are now 60 tons of ood ore on the dump. The Co. will begin to mill ore ds month. The new hoisting works are now com- eted. The building is 30x50; the engine, which is about 30-horse power, is new, as is also the boiler and l the machinery. A carpenter-shop and other im- rovements are soon to be added to the main building, aking it complete in every respect; 25 men will be at to work on Monday, working day and night.

ALPS.—Working 14 men—day and night shift. Taking it 4 tons daily, and now have about 10 tons of ore on he dump. The last assays made gave from $200 to $600 p this ton. The winze on the 164-ft. level looks well. he cross-cut at the 300-ft. level gives a favorable show- g.

SPRING MOUNTAIN TUNNEL.—Have nothing of special mportance to note since last week, further than that nking still continues on No. 3 ledge, day and night, ith good prospects of soon encountering good ore.

SOUTH SIDE.—This Co. is still sinking the shaft, hich is now down 115 ft.; sinking 1 ft. a day.

ALADDIN.—Sinking in the shaft steadily. Plenty of ood ore in sight.

MAZEPPA.—Sinking the main shaft with constantly- mproving indications.

PIOCHE-PHENIX.—No particular change to note.

BOWERY.—Taking out some good ore, and sinking rap- lly on the main shaft.

BROOKLYN.—Sinking the winze from the 75-ft. level ith excellent prospects.

NEWARK.—As usual, no news from the Newark.

PEAVINE. — Sinking the new shaft. Nothing doing in s old works.

ELKO COUNTY.

ELKO CO. MINES.—Virginia *Chronicle*, Aug. 1: A dis- atch from Elko of yesterday says of the excitement ver the new discovery in the northern portion of the ounty: "The rush to the new mining district has been nprecedented since the White Pine excitement. To-day he number leaving for the new camp is greater than esterday. Every available conveyance has been brought nto use for transporting miners' tools, supplies, etc. rospectors and miners from the neighboring camps are aving for the new district in great numbers. A party who came in last night at a late hour and returned in a hort time, reports several well-defined ledges discov- red, bearing rock assaying from $400 to $16,000 per on."

REESE RIVER.

GALENA AND VICINITY.—Reese River *Reveille*, August 1. alena is looking up. There have been sales of mining roperty made here in the last month to the amount of 60,000. The principal part has been sold by McBeth nd Mellandor.

McBeth and Mellander have commenced work on two nore mines.

Every man in the place is at work, and employment or miners is bound to increase.

The mines are all looking well and within three months we will be exporting more money, in ores, from his place, than all of Humboldt county.

The New York Company have their hoisting works ompleted, and are pushing work day and night.

The White & Shiloh Consolidated have bought the attle Monntain mine of McBeth & Mellander, and are t work on both locations taking out ore. Their reduc- ion works are running regularly; they are taking out bout $35,000 per month.

The New York Company are taking steps to put up irst-class redneotion works at a cost of from $75,000 to 100,000.

The English Company's copper mine is looking finely, nd is doing well.

We shlp more ore from this place than any place on he line of the road.

We were not successful while our mines were in Hum- oldt county, bnt things have changed since we became eeldents of the energetic conuty of Lander.

WASHOE.

BELCHER.—Gold Hill *News*, August 9: The main south drift on the 1200-ft. level is still driven vigorously ahead, the face in rich ore. This drift is now in 315 ft., from the north line. The ore breasts at the sill floor on this level are gradually extending to the eastward as the work progresses, the body of ore widening going south- ward. The southeast cross-cut from the main south drift on the 1300-ft level is again being driven ahead, there being no doubt, whatever, judging from the ten- sion of the ore body eastward, where it is being breasted out, that rich vein will be ore lying next to the east wall of the ledge has not yet been reached. The winze 100 feet south of the Crown Point line, from the 1300 to the 1400-ft. levels, is down 25 ft., the whole distance in rich ore. The ore breasts throughout the entire mine have never looked more promising or yielded better than at the present time. Daily yield 450 tons. Average assay of car samples $110. The gross proceeds of the past month amounted to nearly $1,000,000, while the actual outlay outside of supplies purchased, which are equiva- lent to cash on hand, amounted to a little over $170,000. A dividend of a little over $7 per share was paid the stockholders on the 9th instant, aggregating $728,000, leaving a large surplus in the treasury to carry over to next month.

CROWN POINT.—The ore-breasts on the 1000-ft. level are looking finely, showing considerable improvement in the quality of the ore extracted. The ore-breests on the 1200-ft. level are both looking and yielding splen- didly, the ore being all of high grade. The 1300-ft. level never looked better or promised so rich a yield as at present. The north winze from the 1300-ft. level is down 27 ft., the whole distance in ore that will average over $50 per ton. The middle winze is down 17 ft., the entire distance in rich ore. The flow of water from the drill-holes in the face of the east cross-cut from the south drift on the 1400-ft. level continues without abatement. There was shipped during the past month 10,172 tons of ore, the yield of which is estimated at $527,770.

CONSOLIDATED VIRGINIA.—Sinking the shaft has been suspended for the purpose of putting in new pump tanks at the 250 and 500-ft. stations. The heavy stone foundation for the new hoisting and pumping engines is completed, the engines are in place and the other pumping and hoisting machinery fast approaching com- pletion. When it is once in running order, which it will be in a very short time, the body of water now inter- fering with the progress of the work on the 1,167-ft. level will be drained, and the Virginia Consolidated will soon take rank among our other ore-producing mines. No- thing has been done since our last report in the main drift on the 1,167-ft. level from the Gould & Curry shaft.

CALEDONIA.—A fine body of good milling ore, lying nearly against the west wall of the ledge in the north drift on the 500-ft. level, has been developed during the week. Another body of ore, some 60 ft. further to the southward, but lying nearly against the east wall of the ledge, has also been struck. These developments on lower levels of the mine are very encouraging, and augur well for its future prosperity. The winze from the 400-ft. level has made connection with the north drift of the 500-ft. level giving a splendid circulation of pure air, cooling the level and greatly facilitating the progress of the work. The Sapphire mill is kept stead- ily running on ore from the mine.

JUSTICE.—The east cross-cut from the main south drift on the 400-ft. level is still driven energetically ahead, having about 20 ft. more to run to reach the old Cedar Hill chimney, where some excellent ore develop- ments are looked for. Both the main north and south drifts at the 260-ft. level of the Waller Defeat shaft, are still driven ahead without any new developments of in- terest to report. The east cross-cut from the main north drift has developed some fine ore, which it is the inten- tion to commence extraction in a few days.

CHOLLAR-POTOSI.—Daily yield 140 tons of ore, the assay value of which is $30 per ton. The different ore breasts show a decided improvement, and are if any- thing, more promising for future yield of ore than for some time past. The cross-cuts east at the 4th station have developed nothing of value as yet. The machin- ery at the mine is in excellent working condition, and nothing seems to be wanting except the development of other new and rich bodies of ore on the lower levels.

ARIZONA AND UTAH.—Sinking the shaft is making the usual good progress, the rock in the bottom working finely. Sinking the winze in the main east drift at the first station is making good headway, the bottom still in good ore. The pump continues to work to perfec- tion, keeping the water drained from the shaft.

SIERRA NEVADA.—There is little or no change in either the yield or looks of the different ore breasts during the week. Prospecting further to the north-west con- tinues without any important developments to report. Daily yield, 60 tons of ore, keeping the mill running steadily.

SAVAGE.—Cross-cutting and prospecting on the 1,700-ft. level continues with unabated vigor, and no new ore developments to report. Sinking the incline is making excellent progress, the rock in the bottom blasting well. The connection of the main south drift on the 1,700-ft. level with the north drift from the Hale & Norcross, has given a good supply of pure air, and greatly facilitates the work in that portion of the mine.

GOULD & CURRY.—The prospects for finding a body of good milling ore in the east cross-cuts from the main south drift on the 1600-ft. level continues to increase as the work progresses. The main northeast drift on the 1500-ft. level is still driven vigorously ahead, without change of interest to chronicle. The winze from the second station is making good progress, the bottom still in ore. Daily yield 20 tons of low-grade ore from the old upper workings.

SILVER HILL.—The ore-breests of the first station are both looking and yielding finely. The main north drift at the second station is being pushed vigorously ahead to make connection with the north winze from the first level, which will thoroughly ventilate and greatly aid the prosecution of the work in that part of the mine. Daily yield 50 tons of ore, keeping the Bacon Mill steadily running, crushing ore from the mine.

UTAH.—Sinking the shaft has been suspended for a few days on account of the steady increase of water. The stone foundation for the new engine and pumping machinery is finished, the engine is in place, and the other new machinery is being pushed to completion as fast as possible, so that the delay in sinking the shaft will be of very short duration.

CROWN POINT RAVINE.—The main west drift at 250-ft. level is in 230 ft. One hundred feet from the station a south west drift has been started from the main drift, which is in 30 feet, cutting during the week, some feed- ers and stringers of fine, lively metal-bearing quartz, giving excellent indications of ore developments when the main ledge is reached, which is expected in a very short time.

MINT.—The main drift at the first station is in 150 ft., the face in quartz and porphyry, showing streaks and spots of good ore. The main southeast drift at the lower station is in 100 ft., at which point a cross-cut has been run 50 feet to the ledge, developing a hand- some chimney of fine whitish, mineral-bearing quartz, that promises a good ore development.

HALE & NORCROSS.—Daily yield 60 tons of ore, mostly from the second and tenth station levels. Prospecting the lower levels continues with unabated vigor, and no new ore developments of value to chronicle. The foundation for one pair of the boilers is being renewed and other necessary repairs made to the machinery.

KNICKERBOCKER.—The new machinery for pumping air into the mine is completed, and works splendidly. This greatly increases the facilities for driving the prospecting drifts on the 400-ft. level. The southwest cross-cut from the main west drift on the 400-ft. level is driven vigorously ahead, the face in a mixture of clay quartz and porphyry.

DANEY.—Sinking the shaft has been suspended for the present on account of the heavy increase of water, which necessitates the putting in of the pump The erection of the new pumping and hoisting machinery is making excellent progress, and everything will probably be in readiness to resume sinking the shaft by the mid- dle of next month.

BUCKEYE.—The ore breasts at both the second and third stations are looking and yielding finely, in fact the mine never showed better for profitable working than at the present. The mill is kept steadily running on ore from the mine.

NEW YORK CONSOLIDATED.—The shaft is down 300 ft., the sinking making excellent progress. The heavy flow of water struck last week is still decreasing. The pump is working splendidly and handles the supply of water with perfect ease.

OPHIR.—Sinking the shaft is making much better headway than at our last report, the rock in the bottom working much softer. No change of interest to report of the prospecting operations on the 1200 and 1300-ft. levels.

TYLER.—The new pump and other machinery is on the ground ready to place in position, and all will be ready to start up in a few days, when sinking the shaft will be resumed, and good results may be looked for.

OVERMAN.—The prospecting drifts both north and south are still driven energetically ahead, without any change of interest to report for the week. No develop- ments of value for the week in the main west drift.

AMERICAN FLAT.—The water is being steadily drained from the drift of the 450-ft. station of the Baltimore Consolidated, so that work in the face can be resumed in a very short time.

JACON LITTLE.—Prospecting the body of ore struck in the east cross-cut from the main west tunnel is still continued, proving it to be, without doubt, an exten- sive and valuable deposit.

DAYTON.—Work has been resumed on the main west drift at the first station. A drift west has just been started at the second station, 210-ft. level, for the ledge.

OCCIDENTAL.—Daily yield 36 tons of ore. The ore- breasts are looking and yielding finely. The mill is kept steadily running on ore from the mine.

FRANKLIN.—Nothing new to report, except the excel- lent progress of the main tunnel, with favorable indica- tions of soon striking the main ledge.

YELLOW JACKET.—Prospecting the 1,400 and 1,500-ft. levels is pushed vigorously ahead, with no rich ore de- velopments to report for the week.

EMPIRE.—Still driving the up-raise and cross-cuts on the 1,700-ft. level, with no change of interest to report.

IMPERIAL.—Still prospecting the lower levels without any change of interest to chronicle.

THE ALKALI COPPER MINE.—Gold Hill *News*, July 31: This mine was located about a year ago by J. D. Ludwig, Wm. Spregg and J. L. Carter, who are the sole owners and who reside at and work the mines themselves. It is situated eight miles northeast of Ines' Station, at Hot Springs, and about 35 miles from Dayton. The ore ex- tracted yields from 20 to 50 per cent. copper, and is sold by the proprietors of the mine to Birdsall & Co. at Dayton, who use it for amalgamating purposes, and averages about $30 per ton in value to the owners. Worked in this way the mine has not only paid all expenses and ordinary wages to the proprietors, but enabled them last month to declare a small dividend, with a surplus carried over sufficient to ensure another, a little larger this month, which the owners confidently expect to continue to increase as the mine is developed.

Utah.

AMERICAN FORK DISTRICT.

MINERAL FLAT, Salt Lake *Tribune*, August 6.—The Miller mine and furnaces are in full blast. From 60 to 70 men are employed in working on a large body of ore, reducing 10 to 20 tons per day. The smelter has just started; the largest part of the men in the mine are prospecting and have made some valuable discoveries under the management of the new officers. You may expect some flattering reports of the Miller mine and furnace.

THE SILVER GLANCE.—Situated south west of the Miller mine, owned by Jeaman & Haswell, shows a large body of Milling rock, with 200 tons on the dump. Mr. Has- well, Superintendent. They have resumed work.

THE LIVE YANKEE.—Lies between the Miller mine and Glance, owned by Messrs. Nuckols & Gilman. They are working sixteen men, with plenty of ore in the mine and large quantities on the dump.

Near the Yankee lode is Mr. Lloyd & Co., working a hydraulic. They have about fifty tons of fleet galena obtained from the washing away of the dirt. It is said to be worth $25 per ton.

THE BULLION LODE is situated on the divide between the Miller mine and Mineral Flat. This mine was bought last fall. From the surface down 25 ft. shows a vein of galena and carbonate ore two and a half ft. in width, as saying 100 oz. silver and 50 per cent. lead. The mineral gave out at this point. The shaft has been sunk to the depth of 130 ft., is a large vein, but no ore until the last week, when it began to put in an appear- ance again. The bullion is destined to rank among the leading mines.

THE CARIBOO MINE is situated on Mineral Flat, north- east of the Bullion, and owned by Isaac Perrie & Bartlett. The Cariboo shows a vein of galena ore two and a half ft. wide, and is bonded for $20,000.

THE FRANCIS LODE is owned by T. A. Conlee & Kings- bury, and is situated on Mineral Flat, northwest of the Miller mine. This mine was discovered and re- corded last September, and shows a true fissure vein, with crevice matter 3 to 6 ft. in width, and has opened 1,000 ft., which shows a continuous vein. Six shafts have been sunk on the vein varying in depth from 15 to 40 ft. Mineral has been seen in small quantities, which, on being tested, assayed from 250 oz. silver and 60 per cent. lead. Mr. Ander is now running a level in on the vein which is now in 70 ft., and there is every indica- tion that inside of 100 ft., a large body of ore will by struck. Such is my opinion.

THE PITTSBURG MINE is working a small force, but has a large body of ore, and as soon as arrangements are perfected for shipping ore a larger force will be employed, when 50 or 60 tons per day can be produced.

THE ALLEGHANY, TROY AND BELLE KINGSBURY LODES, which lay close to the Pittsburg mine, are being worked by A. J. Coulees. The Alleghany shows a vein of ore 1 ft. in width, with well-defined walls, sampling 60 oz. in silver and 40 per cent. lead, and have run in on this vein 70 ft., with 30 or 40 tons of ore on the dump. The Troy lode has a shaft 40 ft. deep, showing from 1 to 2½ ft. of fine galena ore, sampling 4 oz. in silver and 45 per cent. lead. The Belle Kingsbury shaft, 15 ft. in depth, with a vein of galena ore 10 to 14 in. from the surface, samples 4 oz. in silver and 40 per cent. lead. These 3 lodes can produce from 10 to 15 tons per day.

THE TERRIBLE LODE, owned by McManus & Co., is situated on this hill, and shows a well-defined vein with good walls in quartzite and a good showing of mineral.

New Incorporations.

The following companies have filed certificates of in- corporation in the County Clerk's Office, San Francisco:

WARD ELLIS S. M. CO.—Aug. 9. Location: Robinson District, White Pine Co., Nevada. Directors — G. H. Hallett, G. Davis, A. Bushmore, B. F. Ward and J. M. Buffington. Capital stock, $300,000, in shares of $10 each.

PACIFIC GATE AND DOOR HINGE CO.—Object: To man- ufactnre and renew the Morton Patent Gate and Door Hinge in the States and Territories of the United States lying west of the Rocky Mountains. Directors: R. H. Magill, J. P. Jackson, J. M. Buffington, James S. Dean and R. F. Knox. Capital stock, $100,000, in shares of $10 each.

OLYMPIA RAILWAY AND MINING CO.—Aug. 13. Ob- jects: Mining and doing a general transportation busi- ness in the States of California, Oregon and in Wash- ington Territory, and constructing, conducting and maintaining a railroad (and electro magnetic telegraph line in connection therewith) running from a point at or near Tenino to Budd's Inlet, at or near Olympia, in Washington Territory, of the estimated length of 20 miles. Trustees—George S. Dodge, Charles N. Felton, Gardner T. Lawton and John N. Goodwin, of San Fran- cisco; and Edward S. Salomon, of Washington Territory. Capital stock, $1,000,000, divided into 10,000 shares.

Meetings and Elections.

EASTPORT COOS BAY COAL M. CO, Aug. 13.—Trustees: Levi Stevens, Oliver Eldridge, I. W. Raymond, J. T. Dean, Claus Spreckles, Wm. H. Sharp and J. Lawrence Pool.

AN IMPORTANT DISCOVERY. — While in Tu- olumne county, a few days ago, we were shown specimens of ore taken from the claim of Messrs. Tullock, Knowles and others, located near the summit of the Sierras, in Tuolumne county. While we do not pretend to be an ex- pert in silver ores, we are satisfied that these gentlemen have a valuable mine, and that rich developments will soon be made in that local- ity. We learn from the Tuolumne *Independent* that rock from this claim, taken only twelve feet from the surface, assays at the rate of $208 per ton in silver. The discovery of such rich silver mines on this side of the Sierras will materially aid the development of Tuolumne county, and anything that benefits that county will also benefit San Joaquin. We hope that the favorable reports from this newly-discov- ered mining district may be confirmed, and that these enterprising prospectors may be richly remunerated for their labor. The rock now being taken from this mine is sufficiently rich to warrant the erection of a mill, and, as we are informed that the lead is extensive, there is a probability that this district may soon be one of the most important mining localities on the coast.—*Stockton Independent.*

THE NEW ELKO MINES.—J. W. Hussey and A. J. Roulstone, two mining Superintendents from the Railroad Mining District, returned from the new Cornucopia District, on the 5th, where they went for the purpose of making an investigation of the mines. They report hav- ing found things fully better than represented, and are fully satisfied from present appearances that the District will be one of the best in the State. There has been no thorough prospecting done yet, as the ledges are mostly blind. Startling developments are looked for daily, and other parties just arrived confirm the report of extensive ledges on the opposite side of the mountain, which can be distinctly traced for three-fourths of a mile. A party who has made several locations on these ledges claim there are four clearly defined, and ex- tending to the river, a distance of two miles. Specimens from the first locations continue to be brought in which surpass the first in rich- ness. The most singular feature of the dis- trict is the deceptive appearance of the rock, it having a worthless, honeycomb appearance until broken, and has been passed by untouched by hundreds of old prospectors.

Nickel Mines.

A correspondent of the New York *Times* writes as follows concerning the Gap Nickel mines. Most the nickel of the world, until within a few years, came from Germany, but the discovery of these mines has entirely driven the foreign article from our market, and considerable quantities are now exported to Europe. This deposit is the only one now be- ing worked in this country, and is believed to be the largest yet discovered in the world. The mine is in Lancaster County, Pennsylva- nia, about three miles south of the Gap Station, on the Pensylvania Railroad. It is on the high land separating Chester and Pequea Val- leys, a region rich in minerals; for besides the copper found in connection with the nickel, large deposits of iron and limestone are found a short distance south. The existence of cop- per here was known many years ago, and cop- per was taken out seventy years ago, but the mining is never prosecuted with much vigor, nor with much profit.

About the year 1856 the material mixed with the copper was discovered to be nickel, and at the depth to which the mine now reaches, it predominates. The depth of the mine is 240 feet, and its length several hundred. The ore is very hard, and the mining is carried on altogether by blasting. There are a few Cor- nish miners to take the lead, but the others are generally Americans. A Cornish pumping- engine, of seventy-five horse power, draws half a barrel of water at every stroke from the mine; another draws the ore to the surface. The ore, in appearance, is iron gray, very heavy, and in some pieces the bright copper ore is very prominent. The amount of ore taken from the mine varies from 400 to 500 tons per month. The mining and manipula- tion of this amount, of course, requires a number of workmen, and there are 175 hands employed here and at the furnaces. The ore is hauled in wagons about half a mile to the furnaces, situated on very high ground, over- looking the beautiful Pequea Valley. The situation was chosen because the wind would carry away the disagreeable smoke and gas, and also because of the stores of limestone and flint in the neighborhood.

The ore is first thrown between the jaws of a ponderous iron breaker, by which it is reduc- ed to small fragments weighing about half a pound each. Thence carts convey it to the kilns, which are construeted very much as are the old-fashioned lime-kilns, except that these have a very tall smoke-stack, to carry the smoke and gas out of the way and increase the draft. A kiln, holding eighty or ninety tons, is filled with ore and kindled with a little wood. It burns for about six weeks, its own gas sup- plying the fuel for burning out the impurities. This first step toward purification is followed by a process almost precisely similar to that to which iron ore is subjected. There are three large furnaces, and into these the ore is now put, mixed with powdered flint and limestone (the former predominating) and coke. About three draws are made in twenty-four hours, for the work does not stop night or day, two sets of hands being employed. The product of the furnaces is passed through iron rollers and crushed to powder, in order that it may be more easily transported to Camden, N. J., where the final process of separating the nickel and cop- per, and preparing each for the market is effected. No waste is allowed.

The ore dust, large quantities of which are made in drilling and blasting, is mixed with flux and clay, baked in square bricks, and re- duced in the furnaces, just as is the rest of the ore. The pure nickel commands a high price, varying, of course, according to the demand, but generally over $2 per pound, and its use is rapidly being extended. Not only does this mine supply all of the material for our nickel coins, but it is being extensively used in plat- ing iron and other metals and in various com- pounds. The whole property is owned by a Philadelphia gentleman, and he has by his energy and capital opened up a new branch of industry for the American artisan, and has taken us along another step toward supplying ourselves with the useful in the arts and manu- factures. But not upon the proprietor alone are the benefits of this enterprise falling. The whole surrounding country is benefited. The hands employed form a valuable class of citi- zens. Land in the vicinity of the mines has risen to five times its value twenty years ago.

Thus it is that Pennsylvania, through her valuable mineral deposits, is increasing her wealth by mining and manufacturing interests, even in the midst of her most valuable agri- cultural territory.

RYE PATCH.—A dispatch from Rye Patch, dated the 9th, stating that bullion valued at $3,900 had been shipped, says: The body of ore lately struck in the drain tunnel proves of more value than was at first supposed. The tunnel is now in 12 feet, in ore that mills from $80 to $90 per ton. This development having been made at the depth of 300 feet from the surface, will ultimately prove of great value to this district. The present indications of the mine are favorable, and there is no reason why the surplus earnings of this Company should not be distributed among the stockholders.

AT the last pay day on the Comstock, when nearly all the leading mining companies paid off their employees, nearly half a million dol- lars were disbursed, and yet dull times are com- plained of.

Beverage Plants.

Coffee.

In Fig 1, of our engravings, we give in miniature, the leaf and fruit stalk of the coffee trss, *coffea arabica*, a native of the extreme southwest point of Abyssinia, from which it was introduced into Arahia, which conntry for two cenfuries supplied the world with all the coffee used. Toward the end of the sseventseuth century a coffse plant was received at the botanic garden of Amsterdam. Ahout the heginning of the eighteenth century a plant was introduced into the western hemisphere, either hy the Frsnch at Martinique, or the Dutch at Surinam, which plant was the parent of all the coffes now exported from the West Indies an South America.

The coffss trse occasionly reachss a height of twenty feet, with a stem three or four inches in thickness, but in cultivation it is kept dwarf to facilitats the gathering of the herries. Ths flowers are producsd in denss clusters at the hase of the leaves; they are snowy white in color, and are succsedsd hy nnmerous red, fleshy herries, each of which contains two of ths ssads known as the coffee-berry. Ths berriss are gathered when ripe, and the soft outer pulp is rsmoved hy a machine called the pulpsr, after which they are steeped in watsr to rsmove all mucilaginous matter; they are then carefully dried, and the parchment-like covering of the seeds removed hy means of a mill, which crushes the shelle, and allows the separation of the seeds, which are then ready for market.

The roasting of the herry increases its hulk and diminishes its weight; its essential qualities are also greatly changed, the heat causing the development of the volatile oil and peculiar acid to which the aroma and flavor are due.

Medicinally coffee acts upon the hrain as a stimulant, inciting it to increased activity and producing sleeplessness; hence, it is of great value as an antidote to narcotic poisons. It is also supposed to prevent too rapid waste in the tissuee of the hody, and in that way enables it to support life upon less food. These effects are due to the volatile oil and also to the presence of a peculiar crystallizahle nitrogenous principle termed *Caffeine*. The leaves of the plant likewise contain the same principle, and the inhahitants of the island of Sumatra prefer an infusion of the leaves to that of the herries.

Tea.

The spreading, glossy, green-leaved, evergreen shruh, the *thea viridis*, furnishes material for an immense traffic throughout the world. The native country of the tea plant is uncertain Hitherto the only country in which it has heen found in a really wild state is Upper Assam; but China, where the plant has bsen cultivated for many centuries, has not yet received so thorough an exploration hy hotanical travelers as to warrant the assertion that it is not indigenous to every section of that vast country. A Japanese tradition ascribes its introduction into China to an Indian Buddhist priest who visited that country in the sixth century, which would seem to favor the snpposition of its heing of Indian origin.

Although it has heen introduced into many parts of the glohe, it has heen cultivatcd more extensively and for a longer period in China than in any other region. It is there successfully grown between the twenty-seventh and thirty-second degrees of north latitude, and in Japan as far north as the forty-second degree. It is also cultivated in the island of Bourbon, at St. Helena, and on a large scale in the island of Madeira, at an elevation of 3,000 feet ahove the level of the sea. It is successfully produced in Java, and flourishes on the Himalaya mountains. It has withstood the cool summers and winters of the climate of Britain, and endures the climate of this country as far north as the District of Columhia, where it has heen growing for the past ten years, and can be grown over a vast extent of the United States, so far as climate is concerned; and as regards soil, it is well known that it will grow anywhere and on any soil that is capahle of supporting currant or hlackberry bushes.

Strange that we should have so far signally failed in growing tea in California. As the "heathen Chinese" rank among the hest horticulturists of the world, perhaps they could teach us how to grow tea.

Cacao—Chocolate.

This important article of food is produced by *Theobroma cacao*, a plant extensively cultivated in the West Indies and tropical America, particularly in Trinidad and Grenada. It forms a small tree, seldom reaching over twenty feet in height, with large, oblong and pointed leaves, and clusters of flowers, with a rose-colored calyx and yellowish petals. The fruit varies from six to ten inches in length, and three to five inches in hreadth, and is ohlong, hlunt and marked with ten elevated ribs running lengthwise. Each fruit contains fifty to one hundred seeds, and it is from these that the cacao or chocolate is prepared. The fruit when ripening changes from a green to a deep yellow color; when ripe, it is gathered hy hand, split open, and the seeds removed. The latter are then cleaned of the pulpy matter surrounding them, and subjected to a process of fermentation, for the purpose of developing their color, and when this process is completed they are dried in the sun and packed for transportation.

The seeds are prepared for use by roasting in revolving metal cylinders, and then hruising them to loosen their skins, which are rsmoved by fanning. The cotyledons, commonly called cacao-nibs, are separated in the same manner. The cleaned seeds ars then crushed and ground hetwesn heated rollers, which softens the oily matter and reduces them to a uniform, pasty mass; this is then mixed with variahle quantities of sugar and starch, to form ths different kinds of cacao, or swestened and flavored with vanila or other substances for the formation of chocolate.

The valus of cacao as an article of food is very considerahle, from the large quantity of nutritive matter it contains. In one hundred parts of cacao there are fifty-one of fat or butter, twenty-two of starch and gum, twenty of gluten, and two of the peculiar principle *theobromine*, which contains mors nitrogen than the active principlo of sither tea or coffee. As a rsfreshing heverage, it is much inferior to either of thess well-known articles, which ars used as an infusion only; hut as cacao is taksn into the stomach as a substance, it is an important article of nutrition.

BEVERAGE PLANTS.

Mate.

Paraguay tea, or Yerha de mate, *Ilex Paraguayensis*, (Fig 4.) The leaves of thie South American tree are used in furnishing the hevsrage, yerha mate. They yield the same active bitter principle called theine, which is found in the leaf of the Chinese tea plant, and form a commercial product that occupies the same important position in the domestic economy of South America as the famed China plant does in thie country, and is consumed to the extent of several thousand tons annually. The leavee are prepared hy drying and roasting, not in the fashion of making Chinese teas, but by cutting large branches from the trees, which are placed on hurdles over wood fires, and kept there until the leaves are sufficiently roasted, when they are removed and placed on a hard floor, and the dried leaves knocked off hy beating the branches with sticks. The leaves are then gathered up, reduced to powder in wooden mills, and packed for market. This tea is often packed in sacks made of raw hides, which are sewed together in a square form. The powdered leaves are pressed into the sacks with great force, and when full they are sewed up and exposed to the sun, when the hide dries and tightens over the contents, forming a package nearly as hard and heavy as stone.

There are several grades or sorts of mate tea in the South American markets, valued according to the age of the leaf and the modes of preparation. It is prepared for use hy placing a small quantity of the powder in a cup, and pouring hoiling water over it; the decoction is quaffed or sucked through a *bombilla*, or tuhe having a hulh perforated with minute holes. It has an agrssahle, slightly aromatic odor, rather hitter to the taste, hut very refreshing and restorativs to the body after undergoing grsat fatigue. It is highly relished hy travelers, and it is almost impossihle for those who become accustomed to its uss to discontinue it. It acts in some degree as an aperient and diuretic, and, if taksn in over-dosss, it occasions diseases similar to those produced hy strong liquors.

Quicksilver in San Luis Obispo County.

Ths San Luis Obispo *Tribune*, which is giving an account of ths resources of that county, speaks of the quicksilver interests there as follows: We shall dsvots our present lahors, and work was resumed about a year ago, owing to the riss in the market price of the desired metal which had then commenced. The ore which had heen previously dug out was rsduced, and several handsoms shipments of quicksilver were made to San Francisco. Operations have been in progress ever since, hut on a smaller and mors prudsnt scale than bsfors. Under the management of Mr. W. A. Dennis, it is daily hecoming more and more manifest that this company has a good mine. They have lately struck a good mass of ore, and havs an increased force of miners at work.

The Libsrtad Mine,

Occupies ths same ground formsrly held hy the Sierra and San Pedro companies. It has now heeu at work for about a year, and has in that timc expended over $15,000. It is incorporated. Ou the San Psdro drift a fine body of ors has heen struck, and aftsr running along ths vein for forty feet, the ore now sxtends to ths full width of the drift. A shaft has also heen sunk in the tunnel, and the ore shows better as greater dspth is reached, but work has heen temporarily snspended in this direction on account of ths ahundancs of water. Ths San Francisco shaft, from which ovsr one hundred tons of ors have been extracted, is also idle for the same reason. This compauy is well satisfied with its prospects, and will probahly rssume operations in the fall.

The Rinconada Mines,

Situatsd on ths road to the San José Valley, are under trade with a San Francisco Compauy, and it is expected, should the same be effeeted, that work will be resumed on a grand scale. We have visited these minee, and think that they offer the very best prospects in quicksilver to be found in the county.

In the neighborhood of Camhria a great revival in the search for quicksilver hae been experienced during the past year. Of these,

Ths Keystone

Has heen recently sold for $30,000, cash down, to a rich English Company. They work from twelve to fifteen men continually, and have several hundred tons of rich ore now on the dnmp. They are pushing the work ahead in shaft and tunnel, and are well pleased with thoir purchase. The

Pine Mountain

Compauy has a tunnel run into a ledge over twelve feet wide, with ore of a fine grade. Thie mine is well situated, with plenty of wood and water handy.

The Gibson and Phillips

Mine has a seven foot ledge of very good mineral, a shaft sunk upon it about 35 foet in depth, and a good prospect. It has plenty of wood and water. The

Quien Sabe

Has employed several hands during the past month, and has a well defined ledge, as good as any in the county in point of quality. A large quantity of pay ore could he easily taken from this mine, at moderate expense—and the same may be said of the two last mentioned. If a furnace were in operation at some point convenient to these minee, a large quantity of quicksilver could he immediately shipped. The great necessity, as in most mining enterprises, is a sufficient capital. The ore is not lacking.

There are other quicksilver mines in the county, but we have noticed the principal ones. We have not pereonally visited any except those situated at the Rinconada.

We learn from San Francisco, under date of July 14th, that various capitalists are about to explore these mines with a view to purchaee. The yield of the metal is decreasing throughout the State, its value at a high rate, and the general attention of mining speculators is attracted in this direction.

New South American Mine.—To lighten the gloomy picture of the political situation, we are able to announce that a discovery has been made of rich gold ore at a place called Famatina, in Rioja. The newe has been received cautiously and without enthusiasm; but there is no doubt that a conditional sale of two leagues of land, wherein the discovered gold mines, has been made of $100,000,000 currency (£800,000), and the stamp on the contract has cost $150,000 currency (£1,200) the most costly stamp ever used in this or perhaps any other country. The mine will be difficult to work, heing in a snow-clad region in one of the spurs of the Andes; but the discoverer calculate that the produce of the mine will he 30,000 pate—$30,000 per day.—*Buenos Ayres Times.*

The Pioche *Record* says: The fast freight line between thie place and Palisade consists of forty-two teame drawn by 336 horses, and deliver here about 572,000 pounds of freight per month. Enough freight is now engaged to keep the line running all its teams for six months to come. Besidee this, there is a fast and slow freight line from Toano. An enormous quantity of snpplies is also obtained directly from Salt Lake. Yet, times are dull in Pioche—so they say.

The southeast portion of New Mexico is suffering hadly for want of rain, hnt not so much as the section about Santa Fé. There will he a few grapes, but no other fruit. The lose of the fruit crop falls heavily on many persons who depended on it for their income.

Useful Information.

Production of the Sexes at Will.

Many curious investigations, says a recent medical work, have been instigated in regard to this point in the world of natnre. It is a matter of familiar knowledge that the male and female characteristics of the higher species of the animal creation are not produced in the same individual, as they are in the great majority of the higher species of plants. The organs from which the two are evolved, are, however, so nearly related to each other, in intimate nature, that the one may he readily mistaken for the other, in the earliest period of their formation. Physiologists now incline to the opinion, that the fertilizing vesicle is merely a germ vesicle, in a somewhat more exalted state of development: Mr. Knight has shown that plants, like the oak, that bear the male and female flowers on separate individuals, may he made to produce either at will, by regulating the supply of light and heat, according to the end in view. If the heat be excessive as compared with the light, male flowers only appear; bnt if the light be in excess, female flowers are produced. He also found that whenever the eggs of birds are not allowed to he fertilized until immediately before they are laid, and therefore their own intrinsic development has been carried to the highest possible pitch, before renewed vivification of the germ vesicle is effected, as many as six out of every seven of the birds subsequently proved to be males. " "

Quetelet believes that the relative ages of the male and female parent influence the sex of the offspring produced, to a very considerable extent. In support of his theory, M. Hofacker has showu that when the father is considerably younger than the mother, the proportion of female to male children is generally as ten to nine; but that when, on the contrary, the father is nine years older than the mother, the proportion of male offspring to female is as five to four, and when eighteen years older, as two to one. In a general way, more males of the human species are born into the world than females. If all Europe be included in the estimate, the proportion of male to female births is about 106 to 100. Possibly this preponderance on the side of males may be due to the fact that in civilized communities men, from confidential and other motives, mostly marry women younger than themselves. But there are other reasons why this preponderance exists. Three male children are born dead to every two female.

Ancient Grecian Gardens.—Greece proper, in default of space and kindly soil, confined its gardening to squares, quincunxes, and alleys of elms and plains and figs, a very subordinate feature to their hobby of architectnre and statuary. It was in the Greek Archipelago, to judge from the description of Longus and Achilles Tatius, that the undulations of a volcanic soil, and sea-views enhancing the charms of verdure, flower and foliage, inspired a larger idea of gardening. The landscape consideration; vistas of sheep-dotted plains and sail-clad ocean were eagerly contrived; fruit and forest trees, evergreens, vines, ivy, were combined in the foreground with parterres of wild and cultivated flowers. Architecture did not usurp undue space, and the hardier kinds were planted out with a rare skill for so early a date. In the famous gardens at Antioch, Greek taste blended itself with Oriental parterres of flowers hung on wild crags, myrtles and various shrubs surmounting rocks and grottoes, and clothing the sides of torrents and cascades, bespoke some corresponding mastermind, an adept at molding savage nature with the touch of civilization. Quite opposite in character must have been the hanging gardens of Babylon, in which art and expenditure triumphed over flatness of situation, and elaborate terraces commanded fresh air, fine prospects and perhaps a security more prized than the groves and fountains that crowned them. The gardens of Egypt on the Nile bank, had much more of the architectural character than those of Antioch, but not too much to accord well with the bieratic atmosphere around. Square and formal in flower-beds, water-beds, alleys, and everything, they were relieved here and there by kiosks and pavilions.—*From a new French Volume.*

Why a Lamp Wick Does Not Burn.—If we take a piece of lamp-wicking and place it in the flame of a lamp, it is immediately consumed; bnt the same kind of wicking placed in a lamp and lighted at the top, lasts the whole evening, and, if the lamp is supplied with alcohol, the wick is not even charred. The cause of this was a perfect mystery until a hundred years ago, Dr. Black, of Glasgow, discovered the principle of latent heat. As the oil or the alcohol comes near the flame, it is evaporated, and by this change in its form, a large quantity of heat is destroyed, or rather is latent, so that it does not manifest itself in any way. It requires a great quantity of heat to change a liquid into vapor, so that evaporation always cools surrounding objects. The wick is cooled by the evaporation of the oil or alcohol below the temperature at which it will combine with oxygen—in other words, below the tempeature at which it will burn. Dr. Black's discovery suggested to Watt his great improvement in the steam engine—condensing the steam in a separate vessel from the cylinder. Watt attended Dr. Black's lectures.

The Correct Velocity of Circular Saws.—When circular saws are driven by a waterwheel or steam-engine affording a large surplus of power, the higher the velocity of the saw, the greatsr will bs the capacity for performing any sort of work. On the contrsry, when the power is limited and it is desirable to drive the saw at the most effective velocity consistent with the limited power, experience proves that there is a certain velocity of the teeth, midway between a low and a high velocity, which will render the saw most effective. For example:—A circular saw may he geared to revolve at a velocity so high, that all the available power of the engine will be required to keep it in motion without doing any sawing at all. On the contrary, the journal may be made to revolve so slowly, that the saw would not cut at all satisfactorily. When the propelling power is limited, the aim should he to give the saw the most effective velocity which can be secured only hy several well conducted experiments.

We have in mind a builder who attempted to drive a circular saw about one foot in diameter, for slitting boards and plank, with a one-horse railway power. The saw had been employed in a mill for cutting lath; and was geared to run with a high velocity. When driven by the one horse power, the journal revolved over three thonsand times per minute. With a heavy horse on the railroad power, he could not saw even half-inch boards so fast as he could with a hand saw. But, by redneing the velocity of the saw journal to ahout fourteen hundred revolutions per miuute, and keying a fly-wheel weighing about ninety pounds to the saw journal, he could run the saw through inch boards ahout as fast as he could handle the lumber. For the sake of trying the experiment, he put a 22 inch saw in the place of the 12-inch, and he could not slit lumher as fast as one could with a hand-saw.—*Cabinet Maker.*

Air and Ocean.—"The air is made up of a mixture of two gases, oxygen and nitrogen, and it always contains considerable watery vapor and carbonic acid. In bis new work on chemistry, Prof. Youmans states that if all air were redneed to its average density at the earth's surface, it would extend about five miles high, and that if the above constituents were arranged in layers one over the other, we should have first at the bottom, a bed of water, all over the earth'e surface five inchss deep; next a layer of carbonic acid 13 feet deep; next above, a layer of oxygen gas abont one mile deep; and above this a layer of nitrogen about 4 miles deep. This will help the memory. Sea water coutains about 4 ounces of salt in every gallon. Estimating the ocean to average two miles in depth, the salt, if separated in a solid bed, would line the bottom of the entire ocean to a depth of 140 feet."

Something New on the Carpet.—Another of those fnteresting letters from Vienna in the *Advertiser* shows that the French, in showing their educational apparatus, have adopted transparent glass models of school-houses, showiug the object represented at a glance, just as it is in fact, instead of our equally transparent system of carpeting a model school- house, and giving the incorrect impression that there is such a thing known here as a carpeted grammar school. Why not build the model of miniature silver bricks from Nevada? We must impress these ignorant Europeans with the wealth of America, whether in mineral resonrces or resources of fancy. If we are not rich, we are nothing. Carpets on school-houses by all means; and next—draperies and upholstered lounges.—*Boston Transcript.*

The paunch of an ox or cow is never empty even if the animal has been long without feed. There is always a large mass that remains there, and if it does not fill the whole space, the balance will be filled with gas and vapor which will escape when the rumen is punctured. Mr. Colin has found 150 pounds of food in the stomach of a hull that had not taken food for twenty-four hours, and over 200 pounds in that of a cow examined under the same conditions. Of course this mass does not represent the same quantity of dry food, because when taken into the mouth and stomach it absorbs three or four times its own weight of water.

Chinese Mechanism.—The Chinese are adepts in the art of manufacturing the sheet lead with which they pack teas. It is not rolled as our sheet lead is, but, when melted, is poured upon a marble slab, and another slab is used to press it to a uniform thickness. To such perfection have the Celestials brought the art of soldering that they cannot be excelled. No other workmen can solder with such nicety and so perfectly.

Muslin that will not Inflame.—Dissolve a small piece of alum in the water in which muslins are rinsed. When dry, if a light be put to them, they will smoulder away slowly, but will not break out into a blaze. And this, so far from being serious to muslin, improves its appearance greatly.

In Varnishing the Second Time, if a coat of varnish be not rubbed down level, and freed from all grit and scratches, it may not he expected of the next coat that it will be perfect.

Good Health.

Painless Death.

Chief-Justice Chase, says the *Boston Traveler*, was as fortunate in death as he had been in early life. The immediate cause of his death was rupture of the cerebral artery, whence followed a rush of blood to the brain; and as the rupture took place when he was asleep, he never knew pain, passing calmly away.

Mere dying, it is probable, never is painful, but the circumstances that attend death sometimes are very painful; yet men suffer as much in sickness, from which they eventually recover as they do in those that terminate fatally. A strictly natural death would make no more impression on a man than was made on him by his birth. Nature is not such a blunderer as to make the inevitable a source of pain that can do no good. What is disagreeable in dying is the result of violations of nature's laws.

To die is simply to sleep, death being the rounding of life, as Shakespeare says. To the properly constituted mind, death is no more horrible than is sleep; but then the properly constituted mind has not yet been found. Even those who die calmly or gladly, do so because they have found life a Gordian knot, which can be cut only by the dart of Death, and not because they have philosophically convinced themselves that it is a matter of no moment. Be a man the most confirmed of unbelivers, he must have some doubt—and where there is doubt, be it ever so small, there must be fear. So that when one departs in his sleep he avoids the last perplexity, that which waits on the death-bed of the Christian as well as on the death-bed of the philosopher—which was felt by Adam, and which will be felt by the last of Adam's descendants.

Prolonging Life. — An eminent French chemist, M. Rohing, in a memoir recently presented to the French Academy, announces his belief that the period of human existence may be greatly prolonged, and enters into an argument to show that his belief is based upon sound reasoning. His argument is, that the mineral matter which constitutes an ingredient in most of our food, after the combustion, is in our system to incrust and stiffen the different parts of the body, tends to render imperfect many of the vital processes. He compares human beings to furnaces which are always kindled, and says:—

"Life exists only in combustion, but the combustion which occurs in our bodies, like that which takes place in our chimneys, leave a detritus which is fatal to life. To remove this, he would administer lactic acid with ordinary food. This acid is known to possess the power of removing and destroying the incrustations which form on the arteries, cartilages and valves of the heart. As buttermilk abounds in this acid, and is moreover, an agreeable kind of food, its habitual use, it is urged, will free the system from these causes, which inevitably cause death between the seventy-fifth and the hundredth year."

Hints about Diet.—Most chronic diseases, and many acute ones, are produced at the table. As a rule, no fluid of any kind should be taken at the table, especially if the stomach is weak. The stomach should never be overloaded; not more than two or three articles should be taken at one meal; no stimulants used before eating. Tobacco arrests digestion. Milk is the best diet for infants and children. Tomatoes, with cream and sugar, are healtby and nutritious. Bread and butter is the staff of life and easily digested. Too much salt irritates the stomach. Colds are frequently produced hy drinking hot tea and exposure afterward. Late suppers induce heart disease. Pastry and cake constipate the bowels. Boiled potatoes are not so healthy as baked ones. Fruits are to be eaten at breakfast and dinner. The stomach requires much rest to be healthy. Purgative medicines weaken the bowels. Cheerful conversation promotes digestion, and anger prevents it.

Typhoid Fever.—This infectious disease when once established in a family generally takes nearly all the members, hence many believe it to be contagious. It is not contagious, however, but like cholera, and other kindred diseases, is infectious. The swsepings from an old sewer, leakage from privy vaults, water from wood-lined springs, stench arising from decaying vegetation are all favorable conditions to the acquiring and spread of this disease. An instance is on record where a whole neighborhood passed through a siege of this disease, engendered by using milk from cows that habitually drank from water standing over decaying timber.

The best preventive is to keep the premises clean. Drink pure water, and when unpleasant smells arise, trace them out, remove the cause and apply disinfectants.

The person should be washed thoroughly at least once a week.—*Ex.*

How to Swallow a Pill.—The *Chicago Medical Times* is responsible for the following: "Put the pill under the tongue and behind the teeth, and let the patient immediately take a large swallow of water, and he will neither feel the pill nor taste it. In fact, he cannot tell where it has gone, and I have seen them look about the floor to see if they had not dropped it."

Domestic Economy.

Braised Turkey.

An old English proverb says:

"A turkey roast, is a turkey lost,
A turkey boiled, is a turkey spoiled:
But for a turkey braised, the Lord be praised."

A braised turkey is a thing which once tasted is never forgotten.

"You may break, you may ruin the dish, if you will
But the taste of braised turkey will hang round it still."

Although English literature may be more *larded* with praise of this delicious (but we would here remark not very healthful) dish, yet it is said the French cooks are more skillful in its preparation. Their *modus operandi* is as follows:—Lard a deep pan with pork and calve's foot from which the bone has been removed; season with salt, red and black pepper, thyme, a few whole cloves, one large onion, and a few carrots cut in quarters, lengthwise. On the top of these ingredients lay your turkey, a young one, (and a small one is best,) which has been dressed, stuffed with force-meat made of cream, bread crumbs, rice, and chopped oysters. The wings and legs should be well tied—secured so that the fowl may present a dignified appearance at table. Over all, pour a glass of white wine, a glass of water, one of soup stock, and a wine glass of braady; cover all closely with a piece of buttered paper, or a cover of pastry, and shut the lid of the stew-pan, closely, so there may be no evaporation. Let it bake slowly for three or four hours.

A large turkey would require longer time and more "dip" or gravy. To lard a dish with pork is to cut the pork in long narrow strips and lay them in the bottom. Some cooks lard poultry by drawing a strip of pork through the middle. That the French mode is not for temperance people, is plain. But the brandy and wine could be omitted and broth from oysters, cooked celery, or simply water, be wholly substituted. Red pepper alone is better than black alone, but the best result is obtained by using both. The turkey can be made more compact by breaking the breast bone and putting a weight on it, to press it down. To facilitate its cooking, it might be cut straight through, and the stuffing kept in place by pasting a sheet of buttered paper, or of pastry, neatly over.

Housekeeping Hints.

To make extra nice dish cloth, knit one of candle wicking on coarse woolen needles; one ball is sufficient for a large one.

To wash Oilcloth, use a sponge and warm water. The sponge is much better than a cloth, as it leaves no lint. It is also very nice for cleaning wood-work.

A teaspoonful of saltpeter added to a large pot full of glue will effectually prevent its smelling bad; besides, it causes it to dry faster and harder than it would without it.

To Give a Gloss to Leather.—Apply the white of eggs, beaten up with an equal quantity of cold water, a little sugar candy being added. It is perfectly transparent, dries in a few minutes, and is not rendered sticky by a hot hand, nor affected by weather.

An experienced housekeeper says the best thing for cleaning tinware is common soda. She gives the following directions; —"Dampen a cloth and dip in soda and rub the ware briskly, after which wipe dry. Any blackened ware can be made to look as well as new."

Lemon Cream.—Squeeze a large lemon and grate the peel, add two teacups and a half of water, and heat it over the fire. While it is heating, rub two tablespoonfuls of corn-starch smooth, and beat the yolks of three eggs. Stir the lemon-water slowly into the corn-starch, add the egg, and set it on the fire to thicken gradually, like boiled custard, sweetening to taste. After it is done, beat the whites of the eggs stiff and stir them in; then pour into small tumblers or lemonade glasses, and set them in the ice-box to get very cold.

To Boil Green-Corn.—Trim off all the husks, and put the ears into boiling water with a tablespoonful of salt to a dozen ears. If the fire is brisk, tender corn will be done in fifteen minutes, otherwise in half an hour. Lay a napkin on a large dish, and, after draining off the water from the corn, lay it on, turning the corners of the napkin over it to keep it warm. Some housekeepers prefer to steam the ears of corn, to wrap them in a linen towel while boiling.

COLONEL B. A. M. FROISETH of Salt Lake City, an occasional correspondent of the MINING AND SCIENTIFIC PRESS and well known in connection with the mining interests of Utah, is in this city on a visit. Colonel Froiseth is publisher of an excellent map of Utah and the mining districts, to which we have before referred in our colnmns. He ia at preeent writing a aeriea of letters on Utah mining matters for the London *Mining Journal*.

OVERMAN VS. DARDANELLES.—A dispatch from Virginia dated Aug. 13th aays: The case of the Overman Silver Mining Company, which has heen on trial in the District Court for the past three days, went to the jury this evening. After being out ahout ten minutes, the jnry returned a verdict in favor of the Overman Company.

QUICKSILVER.—Mr. J. B. Taylor of Gold River, Placer county, writes ns that he has about 30 tanks of quicksilver which he does not wish to use, and would like to dispose of. Cannot some of our snhscribers who are in want of the article make him a hid.

RICH deposits of cinnahar are eaid to have been found in the northern part of Mohave county, Arizona. We wish the prospectors would find more of this class of mineral, ae cheap qnicksilver is badly wanted.

THE YELLOW JACKET quicksilver mine, Napa county, hae turned out its firet flask of quicksailver, hut will shortly make regular shipmenta. A rotary drum fnrnace is at work on this mine.

SLUICE mines in San Gabriel Cañon, at the head of Jenkina Ditch, are aaid to he making $5 per day to the hand on dirt from the hed of the river.

A NEPOSIT of coal ie aaid to have heen found in Pica District, 70 milee from Hollister.

VANCOUVER is excited over the quartz mines near there.

The Crown Point Mine.

The Crown Point mine may be considered the representative mine, in point of hullion prodnction, of the Pacific Coast The amount of bullion turned out of late hae been something to astonish the world. Dnring the last fiscal year there were 136,893 tons of ore worked, yielding $6,441,974, making an average total yield of $47.05 per ton the year through. The cost of working thie ore averaged $11.74 per ton. The cost of mining it, including cost of running drifte, repairing shaft, etc., was $8.63 per ton. During the year they paid out for lahor on the mine alone $771,317. The next heaviest item wae for lnmber—$175,522; wood cost $66,858; foundry work, $17,652, and candles, oils, hardware, iron, steel, rope, etc., cost $147,294. These expenses were on the mine alone. They paid out ior crushing 121,828 tons of ore $1,463,824. They paid as expenses on the Rhode Island mill $144,389. Of this the item of water alone was $8,400; that of quicksilver, hardware, etc., $38,232; for wood, $43,744; and for labor, $35,537. The assaying department cost 26,561, itself a good revenne for an ordinary mine. The snm of $2,180,000 was dishursed as dividends.

The ore statement is an interesting one, and is ae follows, omitting the odd pounds on a ton:

MILL.	TONS.	AVERAGE.	TOTAL.
Rhode Island	16,064	$45.20	$581,092.13
Petalums	11,067	62.23	578,685.31
Mexican	31,923	46.64	1,453,889.15
Brunswick	35,447	45.97	1,629,726.66
Morgan's	13,790	47.61	556 689.04
Pioneer	10,153	47.74	484,746.42
Atlas Mill	5,494	55.12	303,375.94
Sapphire	6,874	45.89	315,949.15
French	1,004	35.92	36,087.02
Spring Valley	2,665	31.94	79,635.93
Gold Hill Qusrtz	856	53.76	46,022.46
Woodwarth	1,279	72.83	91,192,66
Douglss	1,371	68.40	80,083.03
	$136,893	47.05	$6,441,974.89

From May 1st, 1870 to May 1st, 1873, the mine has tnrned out 238,548 tons of ore yielding $10,417,729. During the fiscal year 1871, there were 21,087 tous worked, averaging $22.38 per ton or $482,121. Dnring the fiscal year 1872 there were 80,567 tons worked, averaging $43.48 or $3,503,633. During the last fiscal year the increase hae been enormous, as the above figures show. During 1872 two assessments were levied aggregating $78,000. The mine expeuses in deteil, leaving out mine improvement for the three years were ee follows:

	1871.	1872.	1873.	TOTAL.
LABOR	$155,560.00	$362,739.99	$771,317.26	$1,289,617.24
LUMBER	28,974.21	72,793.39	175,522.07	277,289.67
WOOD	35,281.11	50,252.85	65,358.37	152,402.29
SUPPLIES, CASTINGS, ETC.	35,286.30	90,873.82	170,928.96	297,089.08
				$2,016,398.28

In addition to this, mine improvementa for the three years aggregated the sum of $81,911.36, of which the sum of $65,380,58 was paid out in 1872, and only $250 in 1871.

The expense on the Rhode Island mill, helonging to the company, was as follows for three years:

	1871.	1872.	1873.	Total.
Lsbor	$8,183.00	$30,907.83	$35,637.25	$74,628.13
Wood	6,933.12	29,778.25	43,744.85	79,456.22
Quicksilver, Castings, etc.	17,136.04	48,644.76	65,107.22	130,888.01
				$284,972.36

The improvements on thia mill for the three years aggregated $17,872. They also paid for crushing at outside mills $2,462,283 as follows: In 1871, outside mills crushed 18,903 tons at a cost of $191,149.93. In 1872 they cruahed 67,-222 tons at a cost of $807,309.14. In 1873, they crushed 121,828 tons at a cost of $1,463,-824.00. In 1872, the sum of $1,260,000 was paid in dividends, and in 1873, the sum of $2,180,000, making $3,440,000 dnring the three fiscal years. The hullion statement for the three years, according to assay certificates, was aa follows:

Valns in gold	$4,581,284 01
Value in silver	5,780,899 59
Assay grains	54,744 57
Reclsmation, etc	1,671 53
	$10,418,599 80

Probably uo other silver mine in the world has ever turned out snch a vast quantity of ore in the short period of three yeara as the Crown Point haa done. The policy of working the mine in such a mauner is, however, seriously questioned hy many. The fact that snch immense sums are paid ont for milling the ore at outside mills is oue serionely to he considered.

All these mills make a good profit of couree, whereas if the company's mill alone was kept at work, while the hullion prodnction would be very materially reduced, the proportionate profit would he more, and the permanence of the mine, with the likelihood of its lasting on a paying basis for many years, would he estahlished. However, in mining operationa people want to make as much money as possible in the ehortest possible time. Another aolntion of thia lies in the fact that most probably the Crown Point managers are largely interested in the "outaide" mills, and make more money out of the profit of crushing the ore, than out of the mine. If a system of giving the ore to be cruehed to the lowest responsible hidder were inangurated, it migbt help the evil and also to eome extent do away with the importance of election of Trustees, and consequent etock manipulation. If the Trustees felt that there was a law to make them send the ore to the mill giving the lowest hid, perhaps they wonldn't be eo anxions to be trustees.

The liabilities are snmmed up in the expressive, and, in thie connection, unusual word—*none*.

The assets of the company as stated by the Secretary's report before quoted are as follows:

Cash on hand, May 1, 1873	$1,373,891.41
Rhode Island Mill	80,000.00
Mine Improvements, Buildings, etc	100,000.00
Resl Estate	16,000.00
Stock on Hand st Mine	58,287.49
" " Mill	9,596.26
Ore on Hand at Mill	22,468.73
	$2,294,243.89

The Superintendent in speaking of the famous Crown Point ore body or *bonanza*, says it may be briefly described as an immenee wedge-shaped body of ore, with its upper edge nppermost, having a strike or course of N. W. and S. E. and penetrating the earth with an easterly dip of about 36 degreee. This body on the 1,300-ft level ie 360 feet in width, and has an averege breadth of 90 feet, and is by far the richeet level ever opened on the Comstock ledge; the ore on this level averages $75 per ton. The 1,300-ft level has already yielded almost $4,000,000 and will probably yield $10,000,000 more, 75 per cent of of wbich will be clear profit. The body hae steadily increased in length, width and richness from the 900-foot level, where the upper edge wae found, down to the 1300-foot level. From this body they have taken out and crushed from May 1st, 1870, to May 1et 1873, 217,431 tons which have given an average yield of $45. 73 aggregating $9,944,733. Since December 1870, when the ore body was first discovered, and the Crown Point was only a prospecting mine, the shaft has been enlarged by sinking another compartment 1100 feet deep, and douhle cages have increased the working capacity. Three new 80 horse-power engines have been put on the hoisting works. During the fiscal year, 275 feet of raises were made; 1289 feet of winzes suuk; 1330 feet of cross-cuts run; 3826 feet of drifts run, and 800 feet of drifts were retimbered. In 1872 lumber and timber was used amounting to 2,920,00 feet. During the laet fiecal year, there were used 4,760,000 feet, being an increase of $1,840,000 feet for the year.

The history of this mine for the paet three yeare has made it one of the moet notable in the annals of mining. Before that time, or in 1870, the mine was yielding nothing and there was no ore in sight of sufficiently high grade to pay for working, nor was there any iudication of the coming ore body. Of course, if the mine had been abandoned at that time we might never have known of the immense ore body afterwards found. The succees of the Crown Point mine is an incentive to all the otbers on the Comstock, to resnme operations even in the face of discouraging results. The immeneity of the expenses and profits of thie mine for the year will strike any one even at a glance, and it may well be called the representative mine of the Pacific Coast.

The Pacific Cordage Works.

A call lately made at the office of this enterprieing company, No. 116 Front street, furnished na with some intereating facts connected with the great and growing indnstry it so ahle represents. There are two cordage making establishments having their officea and depots in thie city: The San Francisco Cordage Co., and the Pacific Cordage Works. Both of these companiea have a large and constantly increasing bueiuess, and are closely indentified with the manufactnring interesta of the State. We are glad to eee that their products are so extensively patronized here.

The factory of the Pacific Co., is located in Alameda, at the head of San Leandro hay. From it are turned out, annually, no less than three million pounds of cordage, of all descriptiona and sizes, varying from the smallest line which is included under the technical term "cordage" to monster 13 inch cables. Ninety men, women and children are employed in the different departments into which the work of rope making ia subdivided, the latter being occupied in tending ginning and spinning machines.

Among the orders now being filled ia one for aonnding lines for the *Tuscarora*, to he used in making surveya for the Pacific oceanic telegraph cable. Some of these lines are ten miles long in the aingle piece.

The company is endeavoring to encourage the raising of American hemp in California. They could manufacture 400 tona of the raw material per year, at once, were it at hand. To stimnlate our farmera to grow hemp, the company offers to distribute hemp eeed, which they are importing, freely to all who may apply, and promise an advance on ruling Kentucky pricea, Hemp is indigenons here and ia found growing wild in many parta of the State. At present the greater part of our hemp product is obtained from Kentucky and Missouri. The yield of these two Statea have largely decreased of late yeare, falling off ahont one-half during the years 1860-70, on acconnt of the introduction of jute. Hemp culture requires a rich, kindly eoil, free from weede, and capable of enduring extremes of wet and also dry seasone to find which, the subsoil must be examined as well as the surface. Alluvial bottom lands are preferable. If the ground he rich, does not hold water standing on the surface after heavy rains, and in drought does not bake and crack, but has moiet earth within a few inches of the surface, it poseesses the auhsoil for hemp raising. We hope that our farmere will avail themeelves of this offer. A large field for production is opened np in thie direction.

The Lake Superior Tin Swindle.

They have had a big "tin ewindle" in Michigan, which like our "Arizona Diamond Fraud" is one of the wonders of the times. An examining party landed at Otter Head, when there was coneiderable snow on the ground, stayed there a few houre and brought away some rock, which enbsequent analyeis proved to be tin. It was said at the time that Dr. Torrey, of the U. S. Assay Office, tested the ore and reported as follows:

The ore is a true tin stone or cassiterite mixed with quartz; eome of it ie maesive, bnt a coneiderable portion of the specimen examined is in the form of small, tranelucent quadrangnlar prisme, some of which are perfeetly terminated. The average of the samples yielded 33.3 per cent. of metallic tin. It would be easy to concentrate the pulverized mineral to a considerable higher percentage of metal.

Dr. Jennings also tested it, pronounced it tin, and on reporting hie analysis said:

The ores examined are free from any injurioue minerals, and eepecially wolframite, which is often associated with tin ores, and whenever present always depreciates the value of the mining property and product. The epecific gravity of wolframite so closely approximatee the oxide of tin that eny amount of mechanical washing cannot eeparate the two satiefactorily. The result of my investigations has convinced me that the metal prodnced from theee oree cannot be excelled as regards its purity, nor in the cost of working.

Both the above items were printed at the time of the discovery (?). It soon turned out that the ground was salted. It seems that dnring the Winter after the discovery, when navigation wae stopped, one of the purchasere went to England and eold the entire stock for $1,000,-000, conditionally, and on the openiug of navigation this same man and one other went to more thoroughly examine the property; on digging they found the rock soft; on getting down a little it was still in a liquid state. On exploring a little they found four barrels of eilicate of eoda, a box containing clay, and other material. The original vein matrix had been worked out with a pick for some depth, and then filled with artificial rock containing dressed tin of a high percentage. The Marquette *Journal* thinks the explanation by Mr. Harria does not eeem to be all that ia required under the circumstances. Whether the use of the protoxide of sodium, in conjnnction with other materiale, will form a base which will carry prepared tin and at the eame time conform to the nature of rock and matrix for mineral of auy description, ie a qneetion which many will seriously donht. Besides, Capt. Harris informa the *Journal* that the composition contaiuing the tin was poured upon the ledge in such manner as to cause it to run down and fill the fiasures which seamed the faces, and, becoming hardened, gave the ledge the appearance of being an outcrop of tin ore. Here is another point which is open to criticism, as regards the correctness of Capt. Harris' theory. If he is correct, some very bright chemista were engaged in the awindle, and the work wae done some time ago—done probably ahout the time of the opening of Silver Islet.

In whatever manner the fraud was perpetrated, it was done well enough to deceive the people for whom it was intended. The Mr. Harrie referred to ia said to be an old time miner, and it is considered strange, to eay the the least, that he could be ao eaaily fooled. Among the dupea, are a number of practical minere and chemiata, who, aa well aa all the iuvestors, have lost what they put into it. The fact of Harris having made an examination in two hours, of property for which $200,000 was to he paid, reminda us of the equally hasty examination of the Arizona "diamond fielda" by Mr Janin. Mr. Harris is now heing hauled over the coale hy the Lake Superior papers in a manuer far from agreeahle to him.

Reports of tin discoveriea are to he received with a greater atare of doubt than like allegationa in relatiou to other metals. There have been eo many falae reports and hogus discoveries, that people helieve very little in them unless well verified. Every miner who finda a mineral with which he ie not familiar, thinks he haa atruck tin, manganese, or aome not very common metal. We have had a great number of tin discoveriee in this and neighboring States and Territories, not one of which haa ever made any stir in the world as yet. The only tin discoveries of late in the world that have any prominence are thoee in Queensland.

THE San Felipe Company at Cerro Gordo are said to have laid attachment on the property of the Union Mining Company, which will probahly cause a temporary snspension of work.

The Savage Mine.

The annual report of the Savage Mine for the fiscal year ending July 11th has just been published and its showing is not an encouraging one to stockholders. The explorations this year have failed to discover the ore body, those early development was so confidently anticipated at the time of the last annual report. This mine, however, is in good condition and possesses every necessary facility for continuing explorations to a much greater depth than that now reached.

The Superintendent's report sets forth that during the past twelve months the mine yielded 33,414 tons of ore, of which 25,669 tons came from the new mine and 7,714 from the old one. All this ore, together with 295 tons which remained on hand July 1st, 1872, was reduced at custom mills. The proceeds failed to meet the cost of production and reduction, and the result of the year's operations shows a material loss to the company. Work has been kept on in the hope of reaching in one or all of the levels, ore of a higher grade, which would pay to work. We might add also, with the same prospects of sending ore to mills belonging to managers, that they might make a profit even if the stockholders paid for the crushing with assessments. The mine has been entirely unproductive during May and June. Since the last annual report, the main shaft has been sunk, at an incline of 38 degrees, 326 feet below the twelfth station, a sufficient depth to allow the opening of two new stations at intervals of 100 feet. The last station is 1,700 feet vertically below the surface.

From the 13th station a drift was run southeasterly to the south line, connecting with the Hale & Norcross mine. In the cross-cuts made while hunting for the vein, some bunches and seams of ore were found, which for a time gave hopes of favorable results, but as yet no ore body has been found; but the work of prospecting on the 13th level is still going on. On the 14th station a connection has been made, giving a good circulation of air. Below the 10th station, the mine has been opened in that portion only, which lies on the south side of the main shaft. On the north, between the shaft and the Gould & Curry mine, the ground from the 10th station to the 13th is still unprospected. From the 13th station a drift has been run northwesterly 572 feet, to the north line, and connection has recently been made there with the Gould & Curry mine; which connection is valuable for purposes of ventilation, and as an outlet in case of fire or other accident. Progress in the lower levels has been retarded for some months for want of air and by the heat which prevailed. The air forced down the shaft had to be distributed to so many points that it was not enough to enable the men to do efficient work. The connections spoken of, however, remedy this defect. All work on the old mine has been discontinued. The old shaft remains intact, but is kept open as a ventilating shaft. The new shaft and shaft incline are in good order. There are six strong hoilers, with engines, machinery, and gear for hoisting, pumping, etc., all in good working order.

The Secretary's report is an extensive document, giving all the items in detail for each month of the fiscal year. The receipts and disbursements are summed up as follows:

Receipts.

Proceeds of Bullion	$452,074
Assessments, 6, 7, 8, and 9	646,000
Virginia & Truckee R. R.	10,884
Miscellaneous	502
	$1,103,460,25

Disbursements.

Balance overdrawn	$183,708 53
Labor	308,783 50
Fuel	66,687 31
Lumber and Timber	55,635 12
Reduction of Ore at Custom Mills	408,663 75
Material	45,040 22
Water	9,600 00
Assay Office	7,258 23
Taxes	7,443 46
Freight	1,243 07
Surveying in mine	900 00
Exchange on drafts	2,658 84
Discount on bullion to Bank of Cal.	5,651 73
Interest on borrowed money, overdrafts	20,169 05
Horse keeping	1,547 00
Stationery	1,115 71
Legal Expenses	4,503 00
Office rent, etc.	2,818 98
Incidental	6,973 10
Savage Mill (Insurance, watchman, etc)	1,506 00
Real Estate	450 00
Cash on hand	10,703 59
	$1,103,460 25

During the last year the mine has produced 33,414 tons of ore, producing with what was on hand at the previous report the sum of $447,951,88. It cost to produce this ore, $487,104.55. The cost of reduction of 33,695 tons was $404,349.48, an aggregate of cost of reduction and production of $891,454.03—total loss, $441,728.73. The ore yielded as follows:

Average yield of ore	$13 29
Cost of Production	14 58
Cost of Reduction	12 00
Average lose per ton	13 29

This shows that it cost more to *produce* the ore than it yielded, leaving aside the expenses of reduction. The average assay value of the ore reduced, per wagon sample per ton, was $21.86, on the average yield of this ore reduced in bullion, including all reclamations—per cent. of assay value was 60.8.

The operations of the mine for the year compare as follows with the previous years:

Year ending June 30th.	Tons Ore Reduced.	Yield Per Ton.	Cost Per Ton.	Profit Per Ton
1867	69,376	$41	$21 95	$19 99
1868	84,626	46	20 95	19 89
1869	55,479	34	21 12	13 75
1870	13,272	20	36 88	00 00
1671	38,147	21	21 01	00 42
1872	48,392	18	21 95	00 00
1873	33,695	13	26 58	00 00

The ore was all third-class, and the production has steadily decreased since the beginning of the year, as the following shows: Yield in July, 5,128 tons; August, 5,200; September, 5,231; October, 3,917; November, 3,912; December, 4,103; January, 2,781; February, 1,723; March, 1,087; April, 327; during the last two months of the fiscal year no ore was produced.

We condense the following tabular statement of the results of reduction of ore in connection with the assay value of the ore as determined by samples taken from the wagons for the fiscal year:

Months.	Ore Reduced.	Total Assay Value of Ore.	Bullion Produced	Assay Value Per Ton.	Bullion Produced Per Ton.	Assay Value.	Yield Per Cent.
July	5,184	$103,166.31	$64,465.80	$19.89	$12.43	62.5	
Aug.	4,854	97,115.09	79,823.15	20.00	12.32	61.6	
Sept.	5,461	125,051.77	75,049.97	22.90	13.74	60.	
Oct	3,499	97,276.87	58,841.65	24.94	15.09	60.5	
Nov.	3,791	80,854.21	49,779.75	21.35	13.14	61.5	
Dec.	3,901	84,227.40	50 217.84	21 21	12.86	60.4	
Jan.	3,091	73,401.21	44,536.47	23.74	14.75	50.	
Feb.	1,477	33,736.56	17,925.41	22.83	12.13	54.1	
Mar.	1,258	25,861.62	16,110.99	20.55	12.80	62.3	
April.	722	16,944.20	13,169.56	21.93	17.05	77.7	
May	....	.....	345.19	....	....	....	
June	....	.....	.....	....	....	....	
Total	33,695	$736,745.34	$449,771.78				
Averages				$21.86	$313.35	61.	

This last table is an interesting one, showing as it does, in a comprehensive manner, the difference between assay value and real value. The other figures given are most of them very unsatisfactory to stockholders, and the mine ran behind this whole year, and the assessments collected amounted to $640,000, while the bullion yield was $452,074. The Savage mine was incorporated in January, 1862, with a capital of $80,000, which has increased to $3,200,000, in 16,000 shares of $200 each. There are 800 feet of ground in this mine. The first ore was extracted in April, 1863.

From that time until July 10, 1866, the quantity of ore taken from the mine was 111,836 tons, yielding $4,904,562. In the following year, 69,389 tons of ore were raised, yielding $2,900,639. The production of ore in 1867-68 was 87,342 tons, yielding $3,431,486; in 1868-69, 70,970 tons, yielding $1,949,925; in 1869-70, 14,051 tons, yielding $283,923; in 1870-71, 39,715 tons, yielding $827,230; in 1871-72, 47,505 tons, yielding $905,868; in 1872-73, 33,414 tons, yielding $449,725. Thus from April, 1863, to July 1, 1873, the quantity of ore raised was 474,672 tons, yielding $15,653,358. The total receipts for this above period were more than is shown by this aggregate, since there has been some income in each year from other sources. There have been nine assessments levied on stockholders since the opening of the mine, making a grand total of $1,216,000.

There have been fifty-two dividends paid, amounting to $4,548,000. The amount thus disbursed in 1866-7 was $1,120,000; in 1867-8, $1,560,000; and 1868-9, $968,000. The last dividend was paid in June, 1869, while the total amount is $4,548,000. To sum up, we find that the mine has produced 475,000 tons, yielding nearly $16,000,000; another, $1,216,000, has been collected by assessments, and $4,548,000 has been returned as profits to stockholders.

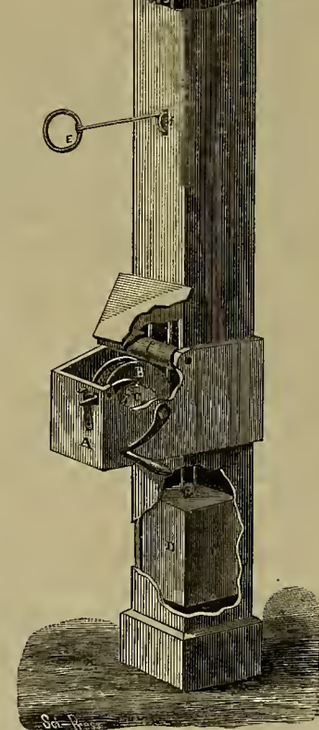
A Valuable Publication.

So rapid has been the progress of science, during the last few years, that it is found almost impossible for the ordinary student to keep pace with its advance. To meet the increased demand for literature in this direction popular scientific books, magazines, etc., have appeared in such numbers, that the student is almost overwhelmed with works of the kind—he is fairly lost in the multitudinous publications devoted to the various branches of scientific knowledge. To meet this condition of things, and to place before him in a compact, condensed form all the important facts and advanced steps connected with the present condition of the physical sciences, those well known publishers, J. B. Lippincott & Co. of Philadelphia, have issued "A Dictionary of Science," embracing Astronomy, Chemistry, Dynamics, Heat, Hydrostatics, Light, Magnetism, Mechanics, Meteorology, Pneumatics, Sound, Statics, etc. The work is illustrated with numerous engravings, and the various leading articles have been prepared with great care by some of the leading scientists of the day.

Science has now ceased to be the study of the chosen few; it is being received more and more into the language of every-day life, and has become essential to the successful prosecution of almost every calling. So rapidly do the facts and deductions of science accumulate, and so complex a character do they often assume when first presented to the world, by those who discover and elaborate them, that it has become absolutely necessary that they should be simplified and popularized before entering into the general literature of the country, through which they are most commonly utilized and brought to bear upon the mechanic arts and other industries. The publishers above named have done a good work in this direction, by presenting to the student and the working man as complete an account as the space admits, of the more strictly experimental science, divested as much as possible of abstruse treatment and difficult formulæ. All recent results and generalizations have been added, and each science, although scattered throughout the book in alphabetical order, is complete in itself. Frequent references are introduced for guiding the mind and introducing the student to collateral subjects and authors. The book forms a volume of over 700 pages, large octavo, closely printed but in very clear and legible type. It will be found a useful addition to every library, and a most convenient book for ready reference. It may be had of A. Roman & Co.

An Improved Clothes-Line Reel and Tightener.

Although clothes-lines are among the necessities of housekeeping appurtenances, they are, like smoking stoves, often the unconscious cause of serious domestic troubles. They always hang in the back yard in a position accurately calculated to either strangle, or injure the noses of, any individual passing, and carefully prepared statistics prove that the average number of persons of the females persuasion who remember to put the line away after using is about one in one hundred. The domestic who systematically removes them at the proper time is to be cherished and an example to be quoted. When left outside, clothes-lines become grimy and dusty and are apt to leave their marks on the linen suspended from them. An addition to these very forcible objections is that of their tendency to stretch at one time and tighten at another, either breaking or sagging down so as to render progress in the rear regions extremely hazardous. Then they are always carelessly fastened to a rusty nail, and every housekeeper will bear testimony that this proceeding is a dangerous one and its results provocative of emphatic language in the kitchen.



IMPROVED CLOTHES-LINE REEL.

In view of these self-evident facts many devices have been invented to overcome the difficulties and render the use of clothes-lines less of a nuisance than formerly. Among them is a new patent recently obtained through our agency by John Brizée, of Alvarado, Alameda county, Cal. As Mr. Brizée lives in a country town where Chinese laundrymen are not so plenty as in San Francisco, he has had experience of the matter and fully relies on an appreciative community for his reward. The improvements consist of an arrangement by which a single shaft is employed for winding both clothes-line and weight line, thus avoiding complication, expense and the liability of the lines becoming fouled. Another improvement is the upright box support inside of which the weight moves down, which forms a part of the reel box; and lastly of an arrangement by which the clothes-line may be tightened at any desired length.

The device consists of an upright box or tube, inside of which a weight, *D*, moves. This box can be of any desired height, and can be either secured upon a proper base on top of the ground or it can be set down in the ground to any desired distance. At the proper height from the ground is made a box extension, *A*, on one side of the tube. A shaft runs across this box, and secured upon this shaft is a large pulley, *B*; one end of the clothes-line is secured to this pulley, and the line is wound upon it by means of crank on the end of the shaft, as shown. The opposite end of this line is carried up and over a pulley, *g*, and through a hole, *f*, in the front of the tube or upright box, at a height corresponding with the height it is desired to have the end of the line elevated from the ground. A ring, *E*, is then secured to the end of the line, to prevent it from being drawn through this hole, *f*, in the box. This weight cord has one end secured to the shaft; hence the pulley, *B*; thence it is carried back to a roller, and up over a pulley, *h*, at the top of this box; thence down to near the bottom of the box, where it is attached to the weight, *D*.

Now, it will be seen that, as the clothes-line is drawn out, the reel or pulley, *B*, is revolved so as to wind up the weight, *D*, but when the strain upon the clothes-line is removed, the weight will wind the shaft in the opposite direction, and thus wind up the line. A strip is secured in each of the angles of the upright box, so as to prevent this weight, *D*, from touching this cord when it moves upward in the box. A ratchet wheel, *C*, is placed on the shaft beside the pulley, *B*, and a pawl engages with the ratchet. The opposite end of the pawl extends to the outside of the box, *A*, as shown, and a hook serves to support the pawl out of contact with this ratchet when its use is not required.

After this clothes-line has been drawn out and the free end fastened to a post or other object, the line can be tightened by means of the crank, and the pawl allowed to engage with the ratchet, so as to keep it at any desired tension. The box extension, *A*, can be provided with a hinged door, so as to serve as a receptacle for clothes-pins, if desired. It will be seen from this description that the device will be an exceedingly useful one in families where washing is done "at home."

PATENTS & INVENTIONS.

Telegraphic List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, Dewey & Co., Publishers and U. S. and Foreign Patent Agents]

By Special Dispatch, Dated Washington, D. C., August 12th, 1873.

For Week Ending July 29th, 1873.*

Carpet Cleaner.—John Spanlding, S. F., Cal.

Hydraulic Jack.—Anthony V. Ojeda, S. F., Cal.

Combined Catch and Lock.—Audy M. Adams, Sacramento, Cal.

Pen Holder.—John S. Orndorff, Virginia City, Nevada.

Smoke and Steam Burner.—John W. Kingman and Adolphus Eurglus, Laramie City, Wyoming Ter.

Washing Fluid.—Nathan W. Lane, Mendocino County, Cal.

Steam Engine.—Andrew Frazer, Virginia City, Nevada.

*The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Soda Gathering.—We had an interesting conversation, yesterday, with Mr. James Duffy, just returned from his soda springs, situated at Bagtown, twenty miles east of Wadsworth. He says he runs two pumps, miners' big-mouthed pumps, sunk in the ground in an artificial reservoir sixty feet square. This reservoir is filled to a certain depth with soda, which bubbles up from springs underneath as fast as it is taken out. The pumps are employed to cast out the soda as it deepens in the artificial reservoir into a number of naturally formed reservoirs which cover between seven and eight acres of ground. The strongly impregnated water comes up warm, but cools off in the "natural" reservoirs where it grows hard and is taken out with pick and shovel. Mr. Duffy says he has one thousand tons of crude soda piled up there now. He has four men at work who could get twenty tons per day if pushed. He is shipping the soda in its crude state, constantly, to San Francisco, where it is made into sal soda, carbonate of soda and caustic soda, at his own manufactory, where five tons of the manufactured stuff are turned out daily. He works his springs three months in the year. He says he gets all the soda he wants during that time; and that the springs are more than inexhaustible. "They heat inexhaustible," he says, "for the more you take away, the more you can get."—*Carson Appeal.*

Hard Times.

For some time past complaints havs bsen heard from all quarters about ths tightness of our money market, about the slackness of all legitimate business, about the long continued dspression iu real estate; complaints from almost svsry line ot trads, manufacture and production; and, latterly, complaints even from those to whom so much of our financial difficulty has been attributed—the stock operators. "Hard timss" have been tbe topic of conversation on the street, and of discussion in tbs columns of the prss. Naturally euough, we have been favored with almost as many separate reasons for, and infallible prescriptions for tbe cure of, our monetary malady, as there have bsen protests. But witb all this agitation, tbe facts have rather been confused than explained.

There seems to be a tendency to seek too far both for causes and for remedies. Iunumerable specific points are bronght forward to explain the ruling state of tbings, while we should look instead to general undermining influences which have been steadily working for years. True, particular circnmstances affect the market temporarily; but in no single fact nor detached series of events can be found satisfactory explanation. Tbere are those who would have us believe tbat we are suffering from the effects of the Cbinese immigration, and that alone, aud look toward its cessation as the one hope. And yet, while denouncing so scrupulously the many objectionable features, they forget to place on the otber pan of the balance tbe immense assistance this much abused cheap labor has rendered in developing the resources of the State. There are others who would have us believe that we are now being justly punished for former false pride with regard to our coin circulation, and who propose an immediate financial millennium, to be bronght about by simply adopting greenbacks and tbe national banking system, forgetting what a chaos of fluctuating values would follow tbe attempt. And tben, as a matter of course, that accommodating *bete noir*, the Central Pacific R. R., comes in for its share of the blame. Probably there are men to be found who would regard cuttiug its tracks and blowing up its bridges as a certaiu and effectual panacea. To this same aggressive monopoly, domineeriug and graspiug as it may be, we owe more than can readily be summed up. Quite lately, it is true, the company was obliged to directly borrow enougb to place tbe six or eight millions of bonds, unsaleable in Europe and returned to us because of want of confidence caused by tbe Goat Island disturbances and perhaps by the late Union Pacific scandal. Tbis drain was momentarily felt, and more sharply than mere subsidizing, yet it cannot account for previously existiug stringency. An indefinite number of points like tbese might be enumerated, but, passiug to the consideration of actual causes of present dullness, we notice first

Want of Capital.

This is acknowledged to be the great waut of the day. Wbile immense amounts daily change hands, there is less money *per capita*, here tban in any State, excepting only two or three depleted Southern States: but California is not yet old enough to be threatened with exbaustion of her soil. And though we have, during twenty years, produced more gold tban tbe rest of the world combined, it bas not been for ourselves. Of late, the treasure shipments have at times even exceeded the production.

We need capital to develop our mines, to move onr crops, and for many purposes; but, above all, to build up our manufactures. Here ie where we lose most. By exporting raw material to the East and to Europe, to be returned again in the shape of finisbed products, we are annually paying an army of transporters, middlemen and outside manufacturers an amount whicb is noue the less appreciable, because it cannot be precisely stated. All this goes out of tbe State. The ratio between exports and imports of manufactured articles, in favor of the latter, is entirely too high. And wbile interior States bave increased (notably Missouri aud Ohio, the former three hundred per cent. during tbe last decade,) rapidly and steadily in amount of capital and labor employed in manufactures, we have remained practically stationary. Yet, perhaps of all our boasted advantages, tbe facility for manufacturing is pre-eminent. Witb a climate tbat admits of equalized labor throughout the year, with coal and iron lying wellnigh untouchbd at our doors, with superior geograpbical position for export to tbe Orient, Californuia is still, in this respect, the sluggard of the sisterbood.

We need plenty of capital at low rates, no matter whence it comes. Capital from England and Germany at tbree to five per cent., if practicable; capital from tbe East, even, if we can do no better, at the rate of seven per cent. A very few, in tbis city, have already obtained foreign capital: tbis gives rise to the expectation tbat more will follow. While we write, money iu New York rules at three to four per cent., on time loans. Tbis is exceptional; but imagine sucb a state of tbings iu San Francisco.

To procure this capital, after all, it is only required that we should make ourselves beard in tbe more distant money markets of the world; to direct attention to the many industries of the Stats that are dragging on a precarious existence or perishing for lack of it, whsn saving tbs difference of (say) eight per cent. would, by itself, place them on a firm footing. When outside capitalists can be made to see tbat tbers are investments to be made here tbat ars among tbe safest of ths safs (with enough money), and that loans can be negotiated on sound real estats at rates remunerative to them, while offering perfect security, then, and then only, can we hops for an improvement tbat will prove lasting. There is an axiom implicitly believed in by business men of what is known as the "old stamp," that high interest is but another name for poor security. This, like so many otbsr wise saws in repute, is adhered to because of its *bizarre* character in lieu of more substantial ground. There is another somewhat conflicting principle in economy: tbat money is to be regarded as any other commodity, and tbat it will briug wbat it is worth at the time to the borrower. Do not our San Francisco savings banks pay depositors ten per cent.? Are tbey, then, regarded as so insecure, because the rate is three times that of the banks of Great Britain? Or, to take anotber illustration, here we have real estate mortgages on the assessed valuation paying one per cent. per month, and in some instances even more. Are these such very shaky investments? Or, again, do our farmers pay eighteen per cent. for money to move or hold their crops, because they are considered to be insolvent? Otber necessaries are imported freely; money alone does not seem, in our case at least, to yield to the otherwise universal laws of snpply and demand. It is said that San Francisco still feels tbe effect of tbe Cbicago and Boston losses. Tbis may or may not be so: at all events, when the insurance companies began to call in their loane, a marked tightening was felt here.

Again, we are in

Want of the Right Kind of Immigration.

We need bere the class of men wbo will add to the wealth of the State, neither drones nor tbose wbo accumnlate money only to take it away. We need skilled labor. That such is the case is proved by the bigh wages men of all trades are receiving. Tbe demand for such is constant, and ever increasing as the country is opened up. But the State being understood abroad to be totally undeveloped and prodnctive of the precious metals only, an ignorant, sbiftless character marks the great mass of immigrants; wbile practiced mechanics and craftsmen are unaware that it is tbeir services which are in request and bring the highest return.

Above all, we have been kept back by the strange

Want of Confidence

In onr resources and ability to develope them, which prevails among ourselves as well as others. In New York and other commercial centers, panics are unavoidable and occasioually happeu, while the intervening time is one of solid prosperity. But here tbe condition of things seems to be reversed: a chronic state of gronndless panic occupies the greater part of tbe time and is broken by rare "flush times," which, it is true, are generally *very* flush times, though ofteu as unfounded on any tangible basis of reason as the previons state of depression bas been. If America at large is characterized by extremes, what shall we say of California? There is no steady middle ground: we are either very higb up; or, as lately, very low down. And in the race for success, how cau we expect to be backed by foreign capital, while manifesting such mistrust of ourselves?

But the market seems to have tonched bottom at last—it could not well bave beeu duller. Already we notice more cbeerful signs; and it is only required that the dowuward swing sbould pause never so slightly, for the balance to turn and assume a reverse position. From the precedents of tbe past, we may look for a state of things as prosperous, financially, as it has been disastrous; the lower down, the higber up, when the change does come. Sucb has ever proved the case. And now we confidently predict a return to better times.

If "hard timcs" would only teach lessons of economy and steadiness, tbey would not be the unmixed evil tbey are.

Zinc ores are the least abundant of any of the coarser metals found in the Uuited States, and yet the supply is considerably in excess of the demand. The zincs of Missouri and Illinois are not looked npon as offering great inducements for profit, and the New Jersey zincs are scarcely known in a distinctive way. In short tbe Lehigb zinc mines furnish one-half of the annual consumption of tbe country. They were opened in 1853, and are now supplying ore for an annual product of 3,000 tons of oxide of zinc, 3,600 tons of metallic zinc, and 3,000 cases of sbeet zinc. These ores are very rich and pure, and exist in large solid deposits. One deposit is being worked wbicb is 23,000 feet square and 75 feet deep. It measures 12 cubic feet to the ton. It is mined at a depth varying from 175 to 300 feet, and there seems to be no doubt but that tbe supply will last many years.

Water Pipes have not, it seems reacbed the limit of perfectibility. It was stated before the American Socieiy of Civil Engineers that whilc tbe daily consumption of water in New York is about 100,000,000 gallons, 500,000,000 gallons are wasted through unrecognized leaks; and that in Boston more than 17,000,000 gallons are used where 8,000,000 gollons should suffice. By more careful coustructiou and operation of waterworks an immense saving might be effected.

The Precious Metals.—Our Future Supply.—Silevr.

At prresent there is an undoubted scarcity of silver, whils ths proportion of gold to tbat metal rapidly increases. Our silver coin is diminishing and deterioring by wear and tsar. The quantity of it in existence is inadequate, and tbe alloy is such as to make the coin purely Governmsnt tokens, just as copper (bronzs) is. A contemporary lately said, "just as the paper circulation is;" that, however, was a mistake, for tbs Bank of England and the other bauks of issne must ksep an equivalsnt in gold, and pay gold on demand over ths counter far papsr. The silver coin, however, is only a token, not being worth more tban two-thirds of its uominal value; tbere is, therefore, less silver in tbat form than the public imagiue. It is often urged that tbe course now pursued by tbe nations of the Continent in gradually adopting a gold coinage will throw an equivalent value of silver upon the market, and it is likely tbat India will adopt tbat course under the auspices of the India Office. But so wedded are the people of India to the cnstoms that except in tbe province of Madras, where they have been long used to a gold piece of the value of £1 10s., tbis process will be slow, although undoubtedly it will be sure. At the same time this change will not on the whole produce anything like the amount of silver for the world's use that is generally supposed; bscause the silver coinage of France, Belgium, Germany, Scandiuavians, &c., is like our own, below par in actual value. Moreover, while gold is supplauting silaer on the Continent of Europe aud in India, otber countries are ahout to adopt a silver coinage, or much enlarge what they have. Egypt, Morocco, Tunis, tbe Republic of Liberia in Africa, are exemplifications of tbis. In British Burmah, and especially in the southern part of tbe Malay peuinsula, tbe American and Mexican dollars are peferred to money in any oth rform. China will not only bave a silver coinage, but requires a vast increase, and the Government of Pekin are said to be preparing for tbe issue of a new Imperial dollar coinage of higb standard. Cochin China, Persia, and the wbole of the States of South America are calling for new dollar silver of purity. There is in the United Kingdom, the United States of North America. Germany, Belgium, Hollaud, Russia, Denmark, Sweded, the South American Republics, and tbe Brazilian Empire a vast advance in the use of silver plate. It is also applied to the arts, aud ornamentation more extensivcly. Silver plating for carriages, harness, saddlery, arms, accourtements, cabinets, apartmeutal and personal decorations, is extending witb wonderful strides. The well-to-do working and agricnltnral classes in the United Kingdom, the United States, and Continental Europe have got into an eager fashion of carrying silver watchss and silver chains and gnards. Silver rings are worn by tbat class more on tho continent of Enrope, and all over that of Amorica except the English contiuental Nortb American possessions. The blacks of eastern aud western Africa, the West Indiss, and tbe sontbern states of the Nortb Americau Uniou are eager to possess silver rings or silver plated rings. The enlargement in the old uses for silver is most extensive, and tbe demand for new uses excessive. Wbere theu is it to come from? Tbe Uuited Kingdom produces a not inconsiderable quantity of silver, but it is generally, if not always, fouud witb lead in comparatively small proportions. In Ireland, however, it is fonnd nearly pure in tbe Tipperary silver mines. Cornwall has some fine siller-lead miues, and no one doubts that there is a considerable area of unworked silver-lead ore in that wonderful country for mines. In Sbropshire silver-lead bas of late years been worked. In fact the wbole country from Shrewsbury, Oswestry, Wem, and Elsmere, crossing tbe Welsh borders, on tbrongb Cardigansbire to tbe immediate vicinity of Aberystwitb, is strewn with argentiferous lead and lead ore. The mines of Cardiganshire have been famous from a remote antiquity, silver to some amount being found with the lead. The Romans worked those mines, compelling the Britons, wbo hated tbe performance, to serve as navvies. Sir Hugh Myddleton in bisday worked a rich mine which enabled bim to construct "the New River," and entitled him to a monument on Islington-green and a statne in one of the exterior nitcbes of the Royal Exchange. Tbe mine he worked bad been wrought before by "the old men," and is still yielding argentiferous lead. In tbe counties of Wales, around Cardigan, lead is found mixed with silver—the Great Van is an illustration; but Cardigan is the centre of tbese deposits, and the Rigbt Hon. John Bright works a mine on tbe Plynlymmons whicb briugs him an income of tens of tbousands a year. The Isle of Man, minute as it is, is rich in silver-lead, as the marvelous returns of the Great Laxity testify. In Ireland this fraternity of metals abounds; it is peculiarly the argentine lead-bearing country of Europe, or perbaps of tbe world. In several countries of Europe this product is found, and there is much uuworked in Spain and Portugal. In Australia we have several good lead and good silver-lead mines, all profitably engaging capital. It is, however, in America tbat the silver of the world is chiefly, according to present evidences, to be in future found; altbough as Spain from her own bowels and her colony of Mexico once served out the silver of the nations, Hispaniola in tranquillity may yet be searched, and not in vein, for pure silver deposits. Sonth America gave the name of Argentine to the combiuatiou of provinces which south and north of tbe Plats yisldsd silver. Potosi was a proverb of wealth, and ths Bolivian Government gleans it from those mines to-day. On the west of the Andss silver abounds; Mexico is, so to speak, saturated.—*English Ex.*

Monthly Values of Our Shipments.

Following is a statement of the monthly aggregate values of merchandise and produce shipments from San Francisco hy way of the ocean, and coin and hullion shipments through regular mercantile channels, for the six months ending June 30, 1873:

	Merchandise.	Treasure.	Totals.
January	$3,885,235	$1,626,742	$5,511,977
February	2,496,736	2,247,123	4,743,859
March	2,620,715	2,554,114	5,174,829
April	1,966,107	2,244,037	4,210,144
May	1,323,605	1,961,844	3,285,449
June	1,366,197	1,715,883	3,082,080
Totals	$13,658,595	$12,349,743	$26,008,338

It is a noteworthy fact, that nearly $12,000,000 of the merchandise trade was for articles of California produce, exclusive of tbe quantities sent hy rail. The heaviest items were Flour aud Grain, the value of whicb was $9,636,000. The next heaviest items were $333,000 for Ores and Quicksilver, $255,000 for Wine and Brandy, $228,000 for Borax, $210,000 for Hides and Wool, $158,000 for Lumher, $61,000 for Salmon, $86,000 for Leather, and $46,000 for Furs and Skins. We regret that we have not the values of the merchandise and produce shipments to Atlantic cities hy rail. The total quantity thus shipped for five months was 17,509,800 lhs, over half of which was Wool. There was also 4,000,000 lbs. of Tea, Coffee, and Wine. The estimated value of the California produce sent across the railroad in five months is $3,000,000. It is not known how much coin and hullion has heen sent through the mails during the past six months, but it is probable that at least $1,000,000 has thus gone. It is safe to say that our combined exports for the first half of the year exceed $30,000,000.

Receipts of Bullion.

The receipts of Coin and Bullion at San Francisco, througb Wells, Fargo & Co.'s Express, for the six months ending June 30th, were as follows:

	Silver Bullion.	Gold Bullion.	Coin.
January	$295,261	$892,477	$917,197
February	323,375	636,325	621,152
March	332,677	653,915	865,379
April	1,298,128	795,404	614,546
May	1,842,283	855,470	687,133
June	970,861	976,513	652,204
Totals	$5,062,586	$4,709,104	$4,358,211

Making a total of $14,129,901. The sources whence this treasure was received are indicated as follows:

From northern and southern mines	$11,627,984
From northern coast route	950,791
From southern coast route	369,026
From Mexico	1,183,100
Total	$14,129,901

The larger proportion of this amount came to hand during the last quarter. We annex a comparison of the quarterly receipts through the above channel:

	1872.	1873.
First quarter	$9,053,203	$5,437,358
Second quarter	8,719,140	8,692,543
Totals	$17,772,343	$14,129,901

The comparison shows a decrease this year of $3,600,000 in the receipts of domestic Coin and Bullion. How far this dcficiency may be accounted for by an increase of direct shipments to the East from the mines, we are at present unable to determine. The movements to and from the interior, through tbe Express Company, bas hecn as follows:

	Received.	Remitted.
January	$917,197	$1,491,140
February	621,152	1,102,813
March	865,979	963,742
April	614,546	1,006,849
